Private Wealth and Private Banking

How the money is actually made, what Goldman's private wealth business wants to be known for, and the real difference between managing an institution's money and managing a person's.

Doc 55 · "Why Goldman Sachs Private Wealth" / "Why private banking" · Goldman figures from the Q3 2026 earnings release · Prepared 6 November 2026 · Supersedes the financials in doc 27

THE THREE THINGS IN HERE YOU WILL NOT GET FROM A CAREERS PAGE

1. Private banking and lending revenue is down, not up. Doc 27 told you it grew 16% in FY2025. In Q3 2026 it *fell 22%* year on year. The reason is not what it looks like, and knowing it is a genuine edge. Section 6.

2. The lending business is not really a revenue business. It is a *retention* business, and that is the strategic answer to "why private banking." Section 8.

3. Your One Goldman Sachs instinct is right — but the real story is better. The founder pipeline is named, dated, and was built because the firm admitted it did not previously have one. Section 12.

WHAT IS IN HERE

1. **Part I** — How private banking actually makes money. Fee structure from first principles.
2. **Part II** — The strategic point about lending that almost no candidate makes.
3. **Part III** — What Goldman Private Wealth wants to be known for, and whether it is true.
4. **Part IV** — How relationship building genuinely differs from asset management.
5. **Part V** — Four industry mechanics that take you a level deeper.
6. **Part VI** — The answers, and rebuilding your "I like building trust" line so it is not generic.

PART I

How private banking actually makes money

1 What a fee structure actually is

You asked what makes a fee structure. Start here, because once you have this frame you can decode any business in finance in about thirty seconds.

Every fee structure answers four questions:

The question	Why it determines everything
What are you paid for?	An outcome, an activity, or simply the continued existence of a relationship. Each produces completely different behaviour.
When do you get paid?	Once at the point of transaction, or continuously while the relationship lasts. This is the episodic-versus-duration distinction you already identified.
What is the fee charged on?	A percentage of assets, a spread on a balance, a share of profit, or a flat amount. The base determines what makes the revenue move.
Who bears the risk if things go wrong?	If markets fall, does your revenue fall with the client's, or is it insulated? This is the question nobody asks and it is the most revealing one.

Apply that to asset management and you get: paid for looking after assets, paid continuously, charged on asset value, and your revenue falls when the client's does. That last point is why asset managers say their interests are aligned — and it is true, though it also means the business is a leveraged bet on markets.

Now apply it to private banking, which is a genuinely different animal.

2 Goldman's three lines, straight from the filing

Goldman does not publish a standalone private wealth revenue figure — Asset & Wealth Management is reported as one segment. But the segment is broken into revenue lines, and those lines *are* the fee structure.

PRIMARY — Goldman Sachs Q3 2026 earnings release

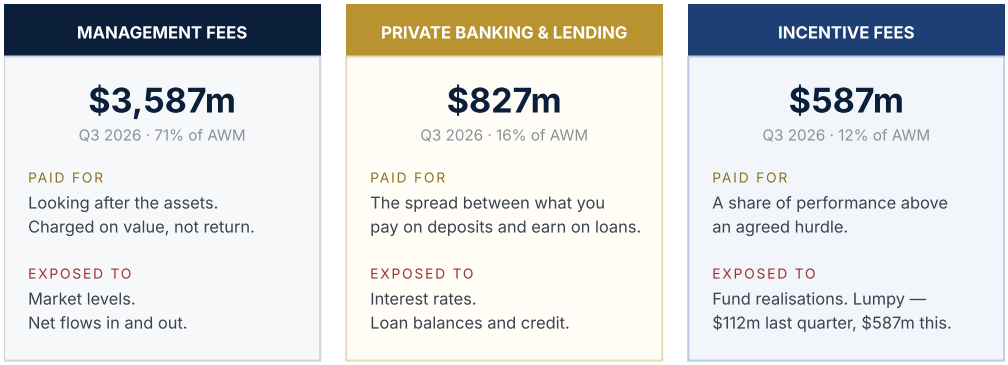

Figure 1 — Three revenue lines, three different businesses. A fourth line, Investments, was $50m. Total AWM net revenues $5,051m.

THE THING TO NOTICE IMMEDIATELY

These three lines do not just earn differently. **They respond to completely different things.** Management fees move with markets. Lending moves with interest rates. Incentive fees move with whether a fund happened to sell something this quarter.

So the business has several partly-independent macro exposures rather than one. When markets fall, the fee line falls — but if rates are high, the lending line holds up. That is a structural reason private banking sits inside wealth management rather than beside it, and it is a sophisticated point to make.

3 Line one: the management fee, mechanically

This is the one everyone half-knows. Here is the full mechanism.

- **The base.** A percentage of the assets the client has with you. Expressed in **basis points** — one basis point is one hundredth of a percent, so 75bps on $50m is $375,000 a year.
- **Tiering.** The rate usually falls as the account gets bigger. The first $10m might be charged at one rate, the next $40m at a lower one. So revenue grows with assets, but not proportionally.
- **Billing.** Typically calculated quarterly on the average or period-end value and charged in arrears. Which means a market fall shows up in revenue within a quarter.
- **What else sits in here.** Fees on the underlying funds a client is invested in, which is why a manager with its own product earns more per pound than one using third-party funds. That is also why "open architecture" — willingness to use other firms' products — is a genuine commercial trade-off rather than just a virtue.

Who bears the risk: you both do. If the client's portfolio falls 20%, your revenue from them falls roughly 20% too. Nothing you did caused it, and you still get paid less. That is alignment, and it is also why the business is market-exposed.

4 Line two: private banking and lending — the spread business

This is the one you said you did not know, and it is completely different in kind.

> You are not charging a fee at all. You are **borrowing money cheaply and lending it out more expensively, and keeping the difference**. That difference is the net interest margin, and it is the entire business.

Where the cheap money comes from

Deposits. Wealthy clients hold cash with the bank — for liquidity, for transactions, for safety. The bank pays them some rate on it, and that rate is below what the bank can earn by lending the money out. Goldman held **$568bn of deposits** across the whole firm at September 2026 PRIMARY — that covers consumer and transaction banking as well as the private bank, so do not attribute it all to wealth.

Where the expensive money goes

Loans to the same clients. And the characteristic private banking loan is unusual: it is **secured against the client's own investment portfolio**, which the bank already holds.

That structure matters enormously. Think about it from the bank's side:

- The collateral is **liquid** — marketable securities you can value daily and sell quickly.
- The collateral is **already in your custody** — you do not have to go and find it.

- The loan-to-value is **conservative**. Goldman's founder lending has run at an average LTV of around 20%, meaning a $100m stake supports roughly a $20m loan. MEDIUM — Fortune, November 2024
- And if the collateral falls in value, you can issue a margin call long before you are underwater.

So it is a lending business with unusually good risk characteristics — which is exactly why banks like it.

What the client gets

The reason they borrow rather than sell. A client with $50m in a portfolio who needs $10m for a house, a business, or a tax bill has two options: sell $10m of assets, triggering capital gains tax and permanently leaving the market — or borrow against the portfolio and keep it intact.

> THE SENTENCE THAT EXPLAINS THE WHOLE PRODUCT
>
> **Lending lets the client solve a liquidity problem without having to solve it by selling.**
>
> That is the product. Everything else is terms. And it is why the adviser who can offer it has a conversation nobody without a balance sheet can have.

Who bears the risk: mostly the client, through the collateral. But the bank bears interest rate risk — if what it pays on deposits rises faster than what it earns on loans, the margin compresses. Hence the different macro exposure.

5 Line three: incentive fees

A share of performance above an agreed hurdle, almost entirely from alternatives — private equity, private credit, real assets. The client keeps most of the gain; the manager takes a slice of the excess.

Look at the volatility in figure 1: **$587m in Q3 2026 against $112m the previous quarter and $76m a year earlier.** PRIMARY That is not a business improving — it is a line that only pays when funds actually realise investments. Nine-month incentive fees were $882m against $308m. Lumpy by design.

6 The finding: the lending line is falling, and the reason is not what it looks like

Doc 27 told you private banking and lending grew 16% in FY2025 to $3.35bn, and was the fastest-growing major line. **That is now out of date and you would be caught out saying it.**

Private banking and lending	Q3 2026	Q3 2025	Change
Quarterly net revenues	$827m	$1,057m	**−22%**
Nine months	$2,154m	$2,571m	**−16%**

Now the part that matters. Goldman's own explanation, in the release:

GOLDMAN SACHS Q3 2026 EARNINGS RELEASE

"The decrease in Private banking and lending net revenues reflected the payment of interest on a previously impaired loan in the prior year period."

In plain English: a loan that had gone bad was written down, and then in Q3 2025 the borrower paid the interest after all. That created a one-off boost in the *comparison* quarter. The fall this year is largely the absence of that windfall, not a deterioration in the underlying business.

WHY THIS SINGLE DETAIL IS WORTH MORE THAN TEN MEMORISED STATISTICS

Every other candidate will say the lending business is growing fast, because that is what the FY2025 coverage said and that is what is still circulating.

You can say: *"The lending line is actually down twenty-two percent year on year — but that's mostly a base effect, because the prior year included interest recovered on a previously impaired loan. The underlying business isn't shrinking."*

That tells the interviewer you read the filing rather than a summary, and that you know the difference between a reported number and what is actually happening. It is the single most impressive twelve seconds available to you in this interview.

CHECK BEFORE YOU SAY IT

These are Q3 2026 figures from the earnings release. If Q4 2026 results have been published by the time you interview, use those instead — and re-read the Private banking and lending commentary, because the base effect may have washed through.

PART II

The strategic point about lending

7 Lending is not primarily a revenue business

Here is the insight that answers "why private banking" better than anything on a careers page.

Private banking and lending is 16% of the division's revenue. Management fees are 71%. On the face of it, lending is the junior partner. So why does the firm put so much effort into it?

Because a loan does something no investment mandate can do: **it makes the client structurally difficult to leave.**

The mechanism

A client can move an investment portfolio to a competitor in about a week. It is an administrative act. Nothing is stopping them.

But a client who has borrowed $20m against that portfolio cannot. The loan is secured on those assets. Moving the portfolio means repaying the loan, which means either finding the cash or selling the assets — which is the exact thing the loan existed to avoid. The relationship has become *load-bearing*.

Figure 2 — Why a 16% revenue line gets disproportionate strategic attention.

SAY THIS AND YOU HAVE ANSWERED "WHY PRIVATE BANKING" PROPERLY

Most candidates will answer that question with "I'm interested in the breadth of working with clients on their whole balance sheet." True, and empty.

You can say: *"Lending is only about sixteen percent of divisional revenue, but I think it's worth more than that strategically — because a portfolio can leave in a week and a secured loan can't. It's the thing that turns an account into a relationship."*

PART III

What Goldman Private Wealth wants to be known for

8 The claim: the apex, not the biggest

Goldman is not trying to be the world's largest wealth manager. Morgan Stanley and UBS compete on scale and run far more client assets. Goldman has deliberately chosen the other strategy: serve the very top of the market, with fewer clients per adviser, and give each one access to the institutional firm.

The usually-cited markers of that positioning: a **$10m minimum**, roughly a **1:25 adviser-to-client ratio**, around **1,000 private wealth advisers**, and an **average account of roughly $70m**.

MEDIUM — widely reported, not Goldman-published; account and adviser figures from Fortune, November 2024

Why the ratio is the number to quote. A 1:25 ratio is the strategy expressed as an operating constraint. It is the difference between a business that scales by adding clients and one that scales by going deeper into the clients it has. If you only remember one of these figures, remember that one — it explains everything else.

9 What third parties actually recognise it for

Euromoney's 2026 private banking awards named Goldman Sachs North America's best for **ultra-high net worth**, for **succession planning**, and for **alternative investments**. MEDIUM — Euromoney 2026 award pages

Those three together tell you what the business thinks it is. Not "best returns" and not "best service" — but *the hardest clients, the longest horizon, and access to things ordinary clients cannot buy.*

Euromoney's own framing of the UHNW award: the business is built around a fully integrated firm spanning investment banking, asset management, global markets and research, all available alongside portfolio construction and estate planning — so advisers can draw on the wider firm *"rather than referring clients elsewhere."*

10 One Goldman Sachs, made concrete

"One Goldman Sachs" is the firm's name for exactly what you described. The useful version is not the slogan but the three situations Euromoney gives, because they are specific enough to repeat:

The client's problem	What One GS means in that moment
A founder is carrying **concentrated equity risk** in the company they built	The adviser can reach into the firm for hedging, structured solutions, lending against the stake, and an eventual sale — rather than telling them to go elsewhere.
A family enterprise needs **cross-border liquidity**	The firm's banking and markets infrastructure is already there, in the jurisdictions involved.
A multi-generational household is **restructuring its governance**	The family office group works alongside the adviser, with estate and succession capability in-house.

11 Your One GS instinct — checked, and made better

You said: *Goldman works well with the investment banking team, gets there early, nurtures the relationship from an early stage, and that feeds into private wealth.*

That is directionally right, and there is a specific, named, dated story behind it. It is also more interesting than you think, because **the firm effectively admitted it was not doing this until recently.**

The founder liquidity pipeline

In April 2024, Goldman launched a programme to serve founders who are wealthy on paper but short of cash. It was organised by **Nishi Somaiya**, global head of private banking, lending and deposits, and **Susie Scher** from investment banking — the idea being to convert Scher's corporate banking clients into Somaiya's private wealth borrowers. MEDIUM — Fortune, November 2024

The reported mechanics:

- Up to **90% of a founder's wealth** can be locked up in shares of the company they created.
- Loans are secured largely against that equity, with the client's wider balance sheet reviewed.
- Average private wealth loan around **$60m**, with some above $200m. Average LTV around **20%**.
- Client companies typically have at least **$100m of revenue** — revenue being the main input into valuing an unlisted stake.

THE DETAIL THAT MAKES THIS WORTH SAYING RATHER THAN JUST KNOWING

Susie Scher's own account was that the firm **had not previously discussed founders' personal financing needs as part of its client conversations.** Goldman declined to say how much business it had been missing.

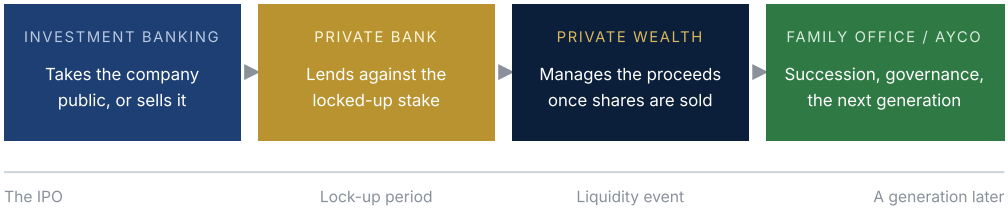

So the honest version of your point is not "Goldman has always been brilliant at connecting the investment bank to the private bank." It is: *"This is a capability they built deliberately and recently, because they could see they were underwriting a founder's IPO and then watching somebody else manage the proceeds."*

That version is more credible, more specific, and considerably harder to dismiss. Saying a firm identified a gap and closed it is a compliment with evidence behind it. Saying a firm has always been great at something is just flattery.

And it has continued

In 2026 Goldman consolidated its alternative investment operations into a unit giving wealth clients and family offices access to late-stage private companies, with a formalised secondary advisory team providing liquidity in private holdings. Reporting also noted that its San Francisco private bank saw loan balances rise around 50% since 2023, driven by AI and technology founders.

MEDIUM — secondary reporting; Goldman's own announcements would be better if you can find them

One client. Four parts of the firm. The adviser never has to say
"that isn't something we do — you'll need to speak to someone else."

Figure 3 — The founder journey, and where each part of Goldman meets it.

PART IV

How relationship building actually differs

12 Nine real differences from asset management

This is the heart of your "why private wealth rather than asset management" answer. Do not say "it's more personal" — everybody says that. Say one or two of these.

	Asset management	Private wealth
Who you talk to	An institution — a committee, a trustee board, usually with a consultant in the room	A person, and often their family. Sometimes with a lawyer or accountant, often with nobody
Whose money it is	Somebody else's. The trustee is a fiduciary acting for members	Their own. They made it, usually by doing something difficult
What the decision is	A process decision that has to be documented and defensible to a board	A personal decision about identity, family and what the money is for
What "risk" means	Tracking error, funding level, volatility against a liability	"Can I still do the thing I built this for." Risk is defined by consequence, not by statistics
Concentration	Diversified by design and by regulation	Often 90% of wealth in one holding. This changes everything
Time horizon	A mandate reviewed every three years or so	Decades, and then the next generation
What ends it	Underperformance, a consultant's rating change, a strategy review	A death, a divorce, a family falling-out, or children who choose someone else
What you sell	A capability — this strategy, this track record, this process	A judgement. They are buying your decisions about their life, not a product
What a bad quarter is	A performance discussion with professionals who expect volatility	Somebody wondering whether their family is going to be alright

13 The one that matters most: concentration

If you take one differentiator, take this one, because it is the most concrete and almost nobody says it.

> An institution is diversified by design. **A founder has ninety percent of their net worth in a single, illiquid holding** — and quite often cannot buy a house. That single fact creates the entire private banking product set.

Follow it through, because it explains the whole business:

- You cannot win them with returns, because their problem is not returns. Their problem is that they are rich and illiquid at the same time.
- So the first conversation is about **liquidity and risk reduction**, not portfolio construction.
- Which is why lending comes first and asset management comes second.
- And which is why the moment to meet them is the **IPO or the sale** — the point at which that problem becomes real and urgent.
- Which is why the investment banking connection matters. It is not cross-selling. It is being present when the problem appears.

> **THAT CHAIN IS YOUR ANSWER**
>
> Five steps, each following from the last, starting from one verifiable fact. If you can deliver that chain you will have given a structurally better answer than someone who simply asserts that One Goldman Sachs is a differentiator.

14 Your "I like building relationships and trust" line — and why it needs rebuilding

> **SAID PLAINLY, THIS IS THE MOST GENERIC SENTENCE IN PRIVATE WEALTH INTERVIEWING**
>
> "I enjoy building relationships and building trust" will be said by essentially every candidate, in essentially those words. It is unfalsifiable, it describes a preference rather than a capability, and it gives the interviewer nothing to probe.
>
> The instinct behind it is right. The sentence has to go.

What trust actually is, mechanically

Trust is not being liked. Liking is pleasant and it does not survive a 20% drawdown.

Trust is **predictability under stress**. It is the client's confidence that they already know how you will behave when something goes wrong — because you behaved that way when it was inconvenient and nobody was watching.

Which is why the private wealth industry's real test is not the pitch. It is **behaviour in drawdowns**. The clients who stay are the ones who trusted the adviser enough not to panic-sell. And the adviser earns that by having been straight with them when there was nothing to gain from it.

Rebuilding your line from your own material

You already have two real proofs of this and you have been underselling both.

THE GENERIC VERSION

"I really enjoy building relationships and establishing trust with clients. In my retail job I built relationships with customers and they came back to me."

Describes a preference. Could be said by anyone about any job.

THE VERSION WITH A MECHANISM

"I think trust is mostly predictability under pressure rather than rapport. In the uniform shop, what brought families back wasn't that I was friendly — it was that I'd tell them when a size would last another year and when it wouldn't, including when that meant a smaller sale."

Describes a behaviour, at a cost, with a result.

And the Dubai story from doc 52 is the stronger proof, if this question comes up and you have not already used it: the money was never lost, so what you actually provided was information to somebody frightened, at a point where there was nothing to report. That is the behaviour-under-pressure version of trust, and it happened to cost you something.

THE ONE-CLAUSE BRIDGE TO THIS BUSINESS

"And I think that matters more in private wealth than almost anywhere, because the test isn't the pitch — it's whether the client calls you or panics when the portfolio is down twenty percent."

One sentence. It converts a personal trait into a commercial observation about the industry, which is the whole trick.

PART V

Four mechanics that take you a level deeper

15 The things nobody mentions

One — share of wallet is where growth actually comes from

A family worth $200m almost never gives it all to one firm. They deliberately hold three or four relationships — partly for diversification of counterparty risk, partly to keep everyone competitive, partly because different firms came in at different moments.

So the growth question in private wealth is rarely "how do we win new clients." It is **"how do we go from being one of their four relationships to being the main one."** That reframes relationship-building as a commercial activity with a measurable target, rather than a personality trait — and it is exactly the sort of reframe that makes an interviewer sit up.

Two — the adviser is the asset, which is a strategic problem

In private wealth the relationship often belongs to the *adviser* rather than the firm. Advisers move, and books of clients move with them. Every large firm is therefore quietly trying to institutionalise relationships: team-based coverage instead of a single adviser, firm-branded platforms, family office groups, and — critically — **lending**, which attaches the client to the balance sheet rather than to a person.

That is the second reason the lending business matters more than its 16% revenue share, and it links straight back to section 7.

Three — referrals are the acquisition channel, which changes what "sales" means

UHNW clients are a closed social network. They are not acquired through advertising or cold outreach; they arrive through introductions from existing clients, lawyers, accountants and bankers. One consequence: your performance with an existing client is also your marketing. Another: the sales cycle is measured in years, and the thing that closes it is usually somebody else's recommendation.

This is why the job attracts people who are patient, and why it punishes people who push.

Four — alternatives access has become the differentiator

When everyone can offer a diversified portfolio of public markets cheaply, the thing a wealthy client cannot get elsewhere is access: private equity, private credit, late-stage private companies, co-investments, secondaries. That is why Euromoney's alternatives award is more meaningful than it sounds, and why Goldman's 2026 private markets platform for wealth clients exists.

Note the connection to Goldman's AUS disclosure: alternative investments reached **$491bn** at September 2026, up from $390bn a year earlier — roughly **26% growth**, the fastest-growing asset class in the firm's supervised assets. PRIMARY

PART VI

The answers

16 Why Goldman Sachs private wealth

ABOUT 110 SECONDS

"Thanks for taking the time to watch this. I'll give three reasons: the strategic choice the business has made, a specific thing I found in the numbers, and why the client problem itself is the part I find interesting.

First, Goldman has chosen depth over scale. It isn't trying to be the biggest wealth manager — a roughly one-to-twenty-five adviser-to-client ratio is a strategy expressed as an operating constraint. It means the business grows by going further into the clients it has rather than adding more of them, and Euromoney's 2026 awards reflect that: best for ultra-high net worth, best for succession planning, best for alternatives. Not best for scale.

Second, something I noticed reading the Q3 results. Private banking and lending revenue was down twenty-two percent year on year — but that's largely a base effect, because the prior-year quarter included interest recovered on a previously impaired loan. What interested me is that lending is only about sixteen percent of divisional revenue, and yet the firm clearly treats it as strategically central. I think that's because a portfolio can move to a competitor in a week and a secured loan can't. Lending is what turns an account into a relationship.

Third, the client problem. A founder can have ninety percent of their net worth in one illiquid holding and still not be able to buy a house. So the first conversation isn't about returns — it's about liquidity and concentration risk. Which is exactly why the investment banking connection matters: it isn't cross-selling, it's being present at the moment the problem appears. Goldman built that pipeline deliberately in 2024, having been open that it hadn't had one before — and I find a firm that identifies a gap and closes it more convincing than one that says it's always been good at something."

17 Why private banking specifically

ABOUT 85 SECONDS

"Thanks for watching. Three things draw me to the banking side rather than purely the investment side.

The first is that it's a genuinely different business model from asset management, and I like that it's a spread business rather than a fee business — you're funding through deposits and lending against the client's own portfolio, so you earn the margin between them. It's exposed to rates rather than to markets, which means it behaves differently in a downturn from the fee line sitting next to it.

The second is the risk structure, which I think is underappreciated. The collateral is liquid, already in your custody, and lent against at around twenty percent loan-to-value — so it's a lending business with unusually good characteristics. That's an interesting combination of credit thinking and client work.

The third is what it does for the relationship, which I think is the real reason it sits inside wealth management. It lets the adviser solve a liquidity problem without forcing the client to sell — which is the one thing a client with concentrated, appreciated holdings genuinely cannot solve on their own. You can't have that conversation without a balance sheet, and I'd rather be somewhere that has one."

18 What not to say

Don't say	Why, and what instead
"Private banking and lending is the fastest-growing line"	**Out of date and wrong.** That was FY2025. It is down 22% year on year in Q3 2026. Use the base-effect explanation instead.
"I enjoy building relationships and trust"	Everyone says it. Use the predictability-under-stress version with the uniform shop behind it.
Quoting a PWM revenue figure	Goldman does not publish one. AWM is reported as a single segment. Saying so is itself a point in your favour.
"Goldman has always been great at connecting IBD to private wealth"	The firm effectively said otherwise in 2024. The "identified a gap and built the pipeline" version is both truer and more impressive.
"It's more personal than institutional asset management"	True and empty. Use concentration, or whose money it is, or what ends the relationship.
Attributing all $568bn of deposits to the private bank	That is firmwide and includes consumer and transaction banking. Say "firmwide deposits" or leave the number out.
Claiming you know the London team's size or structure	You don't, and it is checkable. Stick to what is disclosed.

19 Follow-ups

If they ask	Where to go
"What's the risk in the lending book?"	Concentration and correlation — the collateral is often shares in one company, and if that company falls the client's ability to repay falls at the same moment. Low LTV is the mitigant.
"Why not asset management?"	The nine differences in section 12. Lead with concentration or with whose money it is. Do not disparage asset management.
"What's hard about this job?"	Honest answer: the sales cycle is years, referral-driven, and largely out of your control — and the test of the relationship comes in drawdowns, not in good years.
"How would you win a new client?"	Mostly you wouldn't, directly. Section 15 — referrals and share of wallet. The realistic answer is going deeper with an existing relationship.
"What's the threat to this business?"	Fee pressure from below, adviser mobility taking books out of the door, and — from doc 53 — personalisation technology making bespoke portfolios cheaper for firms that don't charge what Goldman charges.
"Why does Goldman win against Morgan Stanley or UBS?"	Not on scale, where it loses. On access — the institutional platform, alternatives, and a balance sheet to lend against concentrated positions. Be honest that scale is not its claim.

Sourcing and confidence. PRIMARY: all Q3 2026 figures — AWM net revenues $5,051m; Management and other fees $3,587m; Incentive fees $587m (versus $112m in Q2 2026 and $76m in Q3 2025); Private banking and lending $827m versus $1,057m, and $2,154m versus $2,571m for nine months; Investments $50m; nine-month incentive fees $882m versus $308m; firmwide deposits $568bn; alternative investments AUS $491bn at September 2026 versus $390bn a year earlier; and the quoted explanation of the private banking and lending decrease — all from the Goldman Sachs third quarter 2026 earnings release. MEDIUM: the $10m minimum and ~1:25 adviser-to-client ratio, widely reported but not Goldman-published; the founder liquidity pipeline launched April 2024, Nishi Somaiya's and Susie Scher's roles, the ~$60m average loan, ~20% average LTV, ~$100m client company revenue threshold, ~$70m average account, ~1,000 advisers, and the "up to 90% of a founder's wealth" figure — all from Fortune, November 2024, and therefore two years old; Euromoney's 2026 awards for UHNW, succession planning and alternatives, and its framing of the integrated firm; the 2026 private markets platform and secondary advisory team, and the ~50% rise in San Francisco private bank loan balances since 2023, both from secondary reporting I could not verify against Goldman's own announcements. LOW: generic industry fee-mix estimates (roughly half of private bank revenue from fees, 20–30% from net interest) — these came from explainer sites with commercial interests and I have deliberately not used them in the body; use Goldman's own disclosed lines instead. MINE: the four-question fee-structure frame in section 1; the lending-as-retention argument and figure 2; the five-step concentration chain in section 13; the predictability-under-stress definition of trust and the rebuilt line in section 14; the share-of-wallet and adviser-as-asset framing in section 15; and both scripted answers. Re-verify the quarterly figures against the most recent release before you record, and check that requisition 170879 is still the live PWM posting.
