

JPMorganChase

How the firm makes money, and which London summer analyst programme to apply to

A research report written for a reader with no prior knowledge of banking. Every piece of jargon is defined in plain English where it first appears. Figures are dated. Sourced fact and author inference are labelled separately throughout.

Research conducted	31 August 2026 — all web sources accessed on this date
Most recent full-year data	FY2025 (Form 10-K filed 13 February 2026)
Most recent quarterly data	Q2 2026 (reported July 2026)
Recruitment data	JPMorgan live requisition records, read 31 August 2026
Application cycle covered	Summer 2027 London programmes — opened 31 August 2026
Stated application deadline	1 November 2026, 23:55
Prepared for	A student or early-career candidate applying to JPMorgan in London

A warning about this document, before you rely on any of it

Recruitment deadlines, leadership names and financial figures all change. Every material claim below carries a date and a source. Where a source could not be found, the report says "not found" and tells you where to look instead — it does not guess. Where a conclusion is the author's reasoning rather than a published figure, it is marked as inference. Verify the application deadlines yourself before you rely on them: they are the fastest-moving facts here.

Part 1 — Foundations: what a bank actually is

Read this part even if you are tempted to skip it. Everything in Parts 3 to 5 depends on it.

1.1 The two ways a bank makes money

A bank is not one business. It is two quite different money-making machines bolted together, and almost every confusing thing about banking becomes clear once you can tell them apart.

The first machine: net interest income

A **deposit** is money you hand to a bank for safekeeping. Legally it is a loan from you to the bank — which is why the bank can turn round and lend it to somebody else. A **loan** is money the bank hands out and expects back with interest.

The bank pays you a low rate on your deposit and charges a borrower a high rate on their loan. The difference is the profit. That difference, added up across the whole balance sheet, is **net interest income** (NII) — interest earned minus interest paid. Bankers call it "spread" revenue.

The efficiency of this machine is measured by the **net interest margin** (NIM): net interest income divided by the assets that earn interest, expressed as a percentage. It answers "for every £100 of loans and securities we hold, how many pounds of interest profit do we keep?"

The numbers, for JPMorgan, FY2025

JPMorgan earned **\$95.9bn** of net interest income in 2025. Its interest-earning assets yielded **5.05%** on average while its interest-bearing liabilities cost **3.09%** — a spread of 1.96 percentage points. Net interest margin was **2.50%**, down from 2.63% in 2024. Strip out the trading business, where huge low-margin balances distort the picture, and the margin on the real banking book was **3.75%**. *Source: 4Q25 earnings supplement, page 6.*

Two things drive this machine, and you should be able to say both out loud in an interview.

- **Volume.** More deposits and more loans mean more spread, even at an unchanged margin. This is why banks fight so hard for current-account customers who never move.
- **Interest rates.** When central banks raise rates, the rate a bank charges borrowers reprices upward fast, while the rate it pays depositors reprices slowly — most current accounts pay nothing however high rates go. The gap widens and NII surges. When rates fall, the same mechanism runs in reverse.

This is the single most important thing to understand about bank earnings between 2022 and 2026. The rate-rise cycle handed banks an enormous, largely unearned windfall. JPMorgan's guidance for 2026 assumes roughly **83 basis points** of lower average central-bank deposit rates year on year, producing a **\$2bn headwind** to net interest income which the firm expects to more than offset with balance-sheet growth. A basis point is one hundredth of one percent.

The other thing about lending: some borrowers do not pay you back. Banks set aside money in advance for this, called a **provision for credit losses**. Loans actually written off are **net charge-offs**. In 2025 JPMorgan took \$14.2bn of provisions and charged off \$9.8bn — a charge-off rate of 0.74% of loans. Credit costs are the tax that spread revenue pays, and they arrive exactly when the economy turns.

The second machine: fee and non-interest income

The other machine does not require the bank to lend anybody anything. It charges for services. This is **non-interest revenue**, and it comes in five broad flavours.

Type of fee	What the client is paying for	How it behaves	JPM FY2025
Advisory fees	Advice on buying or selling a company	Lumpy; paid only on completion	Part of \$9.6bn IB fees
Underwriting fees	Raising money via shares or bonds; the bank guarantees the proceeds	Cyclical; dies in a downturn	Part of \$9.6bn IB fees
Trading revenue	Buying and selling securities for clients, capturing the spread	Volatile, but volatility helps it	\$27.2bn principal transactions
Asset management fees	Managing money — a percentage of assets each year	Beautifully recurring; tracks markets	\$20.3bn
Payment and card fees	Moving money, processing card transactions, custody	Utility-like; extremely sticky	\$9.1bn lending/deposit fees + \$4.7bn card income

Fee revenue lines, FY2025 reported basis. Source: 4Q25 earnings release financial supplement, page 4. "Principal transactions" is the accounting line that captures most trading revenue.

Why the mix matters enormously

Investors pay more for a pound of fee income than a pound of spread income, and the reason is worth internalising.

- **Spread income consumes capital.** To earn it you must hold a loan on your balance sheet, and regulators force you to hold shareholders' money against that loan in case it goes bad. Fee income from advising on a merger consumes almost none.
- **Spread income is not really yours.** It is substantially a bet on interest rates set by a central bank. A bank whose profits doubled because the Federal Reserve raised rates has not become twice as good at banking.
- **Fee income can be recurring or violently cyclical, and the two are not alike.** Asset management fees arrive every year. Underwriting fees can fall 50% in a bad year. Lumping them together as "fees" hides more than it reveals.

Figure 1 How JPMorgan earned its money in 2025 Roughly half spread, half fees

Figure 1. JPMorgan sits almost exactly on the 50/50 line between the two machines. Very few banks anywhere are this balanced, and the balance is deliberate. Source: 4Q25 earnings supplement (managed basis), FY2025.

1.2 What a "universal bank" is, and why JPMorgan is one

A **universal bank** does all of it: takes deposits from the public, lends to households and companies, advises on takeovers, trades securities, processes payments, and manages investments. JPMorgan is the most complete example in the world.

Model	What it does	What it does not do	Examples
Pure investment bank	Advises companies, underwrites securities, trades markets	No mass retail deposits, so funding is bought in wholesale markets	Historically Goldman Sachs and Morgan Stanley; both now bank holding companies with growing deposit bases
Pure commercial bank	Takes deposits, makes loans, runs branches and payments	Little or no advisory or trading	Lloyds, NatWest; largely Wells Fargo
Pure asset manager	Invests other people's money for a fee	Holds no meaningful balance-sheet risk of its own	BlackRock, Schroders
Universal bank	All of the above under one roof	—	JPMorgan, HSBC, Citigroup, BNP Paribas, Barclays

Why the combination is a genuine advantage

Three real reasons, not marketing ones.

- **Cheap, stable funding.** Retail and corporate deposits are the cheapest money in finance. JPMorgan held \$2.56tn of deposits at end-2025, of which roughly \$604bn on average paid *no interest at all*. A pure investment bank has to borrow in markets that slam shut in a crisis. This is not a small edge; it is the difference between surviving 2008 and not.

- **Cross-selling that is structurally real.** A company that borrows from you needs to hedge, to make payments, and eventually to buy something. Section 3.8 traces a single transaction through six teams.
- **Diversification of the cycle.** Trading thrives on volatility; advisory thrives on calm confidence; lending thrives on growth. Owning all three smooths earnings — 2025 is a textbook illustration, with Markets revenue up 19% while investment banking fees were soft.

And why it is a regulatory headache

Governments dislike institutions that combine insured retail deposits with trading risk, because the state ends up underwriting the gamble. Three consequences shape JPMorgan's daily life:

- **Systemic capital surcharges.** The biggest banks must hold extra capital purely for being big and interconnected. Size is taxed.
- **The Volcker Rule** (US, from the 2010 Dodd-Frank Act) bans banks from most speculative trading with their own money. See section 1.5 for what this actually changed.
- **Structural separation.** The UK's **ring-fencing** regime forces a large retail bank into a separate, separately capitalised legal entity walled off from investment banking. This is live and directly relevant to Chase UK — see sections 2.4 and 3.2.

1.3 The balance sheet, and the five ratios that matter

A balance sheet has two sides that must equal each other. **Assets** are what the bank owns and is owed: loans, bonds, trading positions, cash. **Liabilities** are what it owes: deposits, borrowings. What is left over belongs to shareholders and is called **equity**, or capital.

Figure 13 The balance sheet, simplified
Deposits (\$2.56tn) fund loans (\$1.49tn). Equity is only 8.2% of the total — that is what leverage means.

Smaller components are unlabelled for legibility. Repo and securities borrowed combined for presentation. Source: FY2025 Form 10-K.

Figure 2. Deposits are the foundation of everything. Note how thin the equity layer is: \$362bn of equity supports \$4,425bn of assets. Source: FY2025 Form 10-K, 31 December 2025.

That thinness is the entire point of banking and the entire reason regulators exist. If a bank funds itself with 8% equity and 92% borrowed money, then a loss of just 8% of its assets wipes out the shareholders completely. That amplification is **leverage**. It magnifies returns in good years and kills the institution in bad ones.

Five terms will appear constantly. Learn them now.

Term	What it means in plain English	JPM at end-2025
RWA — risk-weighted assets	Assets re-counted according to how dangerous they are. A government bond might count for almost nothing; a loan to a struggling company counts at full value or more. It is the denominator regulators care about.	\$1,984bn (Standardized)
CET1 ratio	Common Equity Tier 1 capital — the purest shareholder money — divided by RWAs. The headline measure of whether a bank can absorb losses. Regulators set a minimum; banks hold a buffer above it.	14.6% (Standardized)
LCR — liquidity coverage ratio	Whether the bank holds enough instantly-sellable assets to survive 30 days of a run. Solvency and liquidity are different: banks usually die of the second.	111% (must exceed 100%)
Provisions / charge-offs	Money set aside for loans expected to go bad, and loans actually written off.	\$14.2bn / \$9.8bn
ROTCE	Return on tangible common equity. See below — this is the number.	20%

ROTCE, properly explained

Return on equity asks: for every pound shareholders have in this bank, how much profit does it make in a year? **Return on tangible common equity** asks the same question but first strips out **goodwill and intangibles** — the accounting entry created when a bank pays more for an acquisition than the acquired assets are worth on paper. Goodwill cannot absorb a loss. Removing it gives a harder, more honest denominator, which is why it is the standard.

JPMorgan reported **20% ROTCE for 2025** (17% ROE). Its stated **through-the-cycle target is 17%**, and management was asked at the February 2026 Company Update whether that target should be raised, given performance has been above it. They said no, and the reasoning is the most useful thing a candidate can quote:

Jeremy Barnum, Chief Financial Officer, 2026 Company Update, 23 February 2026

"ROTCE is an output, not an input. What we mean by that is that we do not make decisions in order to achieve a particular outcome on ROTCE. Our focus is on growing long-term shareholder value, which we believe is best approximated by our ability to deploy capital at returns in excess of our cost of equity."

The practical implication: JPMorgan will deliberately deploy capital into businesses returning *less* than 17%, so long as they beat the cost of equity, because that adds absolute economic profit even while diluting the percentage. If you say this in an interview you will be ahead of most candidates, who assume the firm is maximising a ratio.

1.4 Core investment banking concepts

"Investment banking" in the narrow sense means helping companies do two things: buy and sell other companies, and raise money.

M&A advisory

Mergers and acquisitions advisory means advising a company that is buying, selling or defending itself. The bank builds a valuation, advises on price and structure, manages the negotiation and the process. It is paid a **success fee**, typically a percentage of deal value, and typically *only if the deal completes*. This is pure intellectual-property revenue: it consumes essentially no capital, which is why it carries such prestige internally and why the returns are so high when volumes are good.

Capital markets: ECM and DCM

Equity capital markets (ECM) raises money by selling shares — a company's first sale is an **IPO**, or initial public offering. **Debt capital markets** (DCM) raises money by selling bonds, which are tradeable IOUs paying interest.

Both involve **underwriting**, and this is the concept people get wrong. Underwriting does not mean "selling". It means the bank *guarantees* the company will receive the money, and then takes the risk of placing the securities with investors. If demand collapses between pricing and settlement, the bank owns the stock. The fee — usually a percentage of the amount raised — is payment for absorbing that risk, not for the paperwork.

Leveraged finance is the specialist end of DCM: arranging debt for companies that are already heavily indebted, most often to fund a private-equity buyout. Higher risk, materially higher fees. JPMorgan disclosed in 4Q25 that part of its credit provision came from "an update to loss assumptions on certain leveraged loans" — a reminder that the risk is real.

League tables, sponsors and coverage

A **league table** ranks banks by deal volume or fees earned over a period. They matter more than they should: they are the industry's scoreboard, they are used in pitches, and bankers are measured against them. JPMorgan ranked **#1 for global investment banking fees in 2025 with an 8.4% share of the total fee pool**, and 9.3% year-to-date at the half-year 2026.

Sponsors means private equity firms — funds that buy companies using large amounts of borrowed money, improve them, and sell them on. They are the most valuable client group in the industry because a single sponsor generates acquisition advisory, debt underwriting, later refinancing, and eventually an exit. Banks run dedicated **sponsor coverage** teams for this reason.

Coverage is how banks organise client relationships: by **industry** (Healthcare, Technology, Consumer & Retail, Financial Institutions, Real Estate), by **country**, or by **product**. The 2027 London investment banking posting names exactly these groups, which tells you the structure is real and current.

1.5 Core markets concepts

"Markets" is the trading business. It is the part outsiders understand worst, largely because films have taught everyone the wrong model.

Sales versus trading

Sales people cover investing institutions — pension funds, hedge funds, insurers, asset managers. They bring those clients ideas and take their orders. **Traders** price the risk and manage the resulting position. **Structurers** design bespoke instruments for clients with an unusual problem. They sit metres apart and are usually on the same desk.

Market making, and how a desk actually earns money

A **market maker** quotes two prices continuously: the price at which it will buy (the **bid**) and the price at which it will sell (the **offer** or ask). The gap is the **bid-ask spread**, and that gap is the fee for providing **liquidity** — the service of being willing to trade when the client wants to, rather than when it happens to be convenient.

This is the crucial distinction. **Proprietary trading** means betting the bank's own money on a market direction. The Volcker Rule largely banned it for US banks after 2010. Market making is different in kind: the desk is not trying to predict the market, it is trying to earn the spread many thousands of times while hedging the risk it accumulates in between.

So how does a modern trading desk make money?

Chiefly four ways. **(1) Bid-ask spread** — earned in tiny amounts on enormous volume. **(2) Financing** — lending money and securities to clients, especially hedge funds, and charging for it. **(3) Structuring** — designing a bespoke derivative and charging a margin for the complexity. **(4) Residual risk** — a desk that has bought from a client holds the position for minutes or days before offsetting it, and is paid for warehousing that risk.

The phrase "**client franchise**" means the recurring flow of client business that generates all four. It is the asset. A desk with a strong franchise sees more orders, which means better information about supply and demand, which means it can quote tighter prices, which attracts more orders. Scale compounds. This is precisely why JPMorgan's Markets business is structurally hard to dislodge.

The vocabulary you will be expected to know

Term	Plain English
Cash vs derivatives	"Cash" means trading the actual thing — a share, a bond. A "derivative" is a contract whose value is derived from something else, used to hedge or to take exposure without owning the underlying asset.
Flow vs structured	"Flow" is high-volume standardised business earning thin margins. "Structured" is bespoke, complex and higher-margin.
Prime brokerage	The bundle of services sold to hedge funds: lending them money to trade with (leverage), lending them shares to sell short, holding their assets, clearing their trades. Balance-sheet heavy, highly profitable, and the single largest driver of JPMorgan's 40% jump in Equity Markets revenue in 4Q25.
Delta One	Desks trading instruments that move one-for-one with an underlying index — ETFs, swaps, futures. Systematic, technology-intensive.
Securitised products	Loans (mortgages, car loans, credit-card receivables) bundled into tradeable bonds.
Emerging markets	Trading in the currencies and debt of developing economies. Higher margin, higher risk.

Part 2 — What JPMorganChase actually is

Scale, lineage, who runs it, and — at length — what it does in London.

2.1 How it got here: a firm assembled from crises

JPMorganChase is not an organically grown company. It is a stack of acquisitions, several of them made during financial panics when the target had no other options. Understanding the lineage explains why the firm looks the way it does.

Year	What was acquired	Why it mattered
1799-1877	Predecessor institutions including the Bank of the Manhattan Company and Chemical Bank	The New York retail and commercial banking roots that eventually became Chase.
1871	J.P. Morgan & Co. founded	The blue-chip corporate advisory franchise and the name. For a century this was the most powerful private bank in America.
2000	Chase Manhattan merges with J.P. Morgan & Co.	Married a large commercial bank to an elite advisory house. This is the origin of the universal-bank model the firm still runs.
2004	Bank One	Brought a huge credit-card business, a Midwest branch network — and Jamie Dimon, who became CEO in 2005.
2008	Bear Stearns	A collapsing investment bank bought in days during the financial crisis, with Federal Reserve support. Added prime brokerage and clearing.
2008	Washington Mutual	The largest bank failure in US history, bought out of receivership. Added West Coast retail deposits and branches.
2023	First Republic Bank	Seized by regulators during the 2023 regional-banking crisis and sold to JPMorgan. Added a wealthy coastal client base and private-banking relationships.
2025-26	Apple Card portfolio	JPMorgan agreed to become the issuer of the Apple Card. It booked a \$2.2bn reserve in 4Q25 for the forward purchase commitment and took roughly 25bp off its CET1 ratio.

The pre-2008 lineage above is general business history rather than a figure taken from a document, and is marked as background knowledge. The 2023 First Republic transaction, and the 2025–26 Apple Card reserve and capital impact, are sourced to the FY2025 Form 10-K and the 4Q25 earnings release.

The pattern worth noticing

Three of JPMorgan's most important acquisitions — Bear Stearns, Washington Mutual and First Republic — were bought in a crisis, cheaply, because the firm was one of very few institutions strong enough to buy anything at all. This is the "fortress balance sheet" doctrine paying for itself, and it is the strategic argument that runs through section 4.1. Being over-capitalised looks wasteful for nine years and decisive in the tenth.

2.2 Scale today

Metric	2025	2024	2023	Note
Total net revenue	\$182.4bn	\$177.6bn	\$158.1bn	2024 included a \$7.9bn one-off Visa gain
Net income	\$57.0bn	\$58.5bn	\$49.6bn	2025 fall is optical: see note
Diluted EPS	\$20.02	\$19.75	\$16.23	Rose despite lower net income — buybacks
ROE	17%	18%	17%	
ROTCE	20%	22%	21%	Target is 17% through the cycle

Metric	2025	2024	2023	Note
Overhead ratio	52%	52%	55%	Expense as % of revenue
Total assets	\$4,424.9bn	\$4,002.8bn	\$3,875.4bn	\$5.0tn by 30 June 2026
Deposits	\$2,559.3bn	\$2,406.0bn	\$2,400.7bn	
Loans	\$1,493.4bn	\$1,348.0bn	\$1,323.7bn	
Common equity	\$342.4bn	\$324.7bn	\$300.5bn	
CET1 ratio	14.6%	15.7%	15.0%	Apple Card cost ~25bp
Market capitalisation	\$868.8bn	\$670.6bn	\$489.3bn	Up 78% over two years
Tangible book value / share	\$107.56	\$97.30	\$86.08	
Employees	318,512	317,233	309,926	66 countries; 58% in the US
Net charge-off rate	0.74%	0.68%	0.52%	Credit normalising upward

Source: FY2025 Form 10-K, three-year summary of consolidated financial highlights, page 46. Filed 13 February 2026. All figures as at or for the year ended 31 December.

Figure 3. Net income dipped in 2025 only because 2024 contained a \$7.9bn one-off gain on Visa shares. Underlying pre-provision profit rose. Source: FY2025 Form 10-K.

Assets under management reached **\$4.8tn** at end-2025 and total client assets **\$7.1tn**, both up around 18-20%. By 30 June 2026 those had reached **\$5.1tn** and **\$7.7tn**. The firm extended \$1.9tn of credit and capital in the first half of 2026 alone.

Read the most recent quarter carefully — it is not a run-rate

In Q2 2026 JPMorgan reported its highest quarterly profit ever: net income of **\$21.2bn** and ROTCE of **29%**. Both are flattered. The quarter included a **\$4.6bn gain** from a Visa share exchange and \$1.0bn of other equity investment gains, and Equity Markets revenue jumped **86%** year on year. Excluding those significant items, net income was **\$16.9bn** and ROTCE **23%**. Quote the adjusted number in an interview, and say why. Source: Q26 earnings release, filed as an SEC 8-K exhibit.

2.3 Leadership — and a genuinely important recent change

Jamie Dimon has been Chairman and Chief Executive since 2005–06 and is the dominant figure in global banking. The succession question has hung over the firm for a decade. In June 2026 it moved decisively.

25 June 2026 — the succession field narrowed

JPMorganChase named **Doug Petno** and **Troy Rohrbaugh** as **Co-Presidents of the firm**, effective immediately. Both had been Co-CEOs of the Commercial & Investment Bank. Petno becomes **sole CEO of the CIB**; Rohrbaugh moves across to become **CEO of Consumer & Community Banking**.

Marianne Lake, the CEO of CCB and for years regarded as the leading internal successor, is **retiring** after more than 25 years.

Dimon called it "an important step in our Board's thoughtful process around succession planning". No timetable for his own departure was given. Retention equity awards granted the previous day reinforced the ranking: **\$30m each** to Petno and Rohrbaugh, **\$20m each** to Mary Erdoes and Jennifer Piepszak.

If you interview using an org chart more than a few months old you will name the wrong CCB head.

Operating Committee member	Title
Jamie Dimon	Chairman and Chief Executive Officer
Doug Petno	Co-President of JPMorganChase & CEO of Commercial & Investment Bank
Troy Rohrbaugh	Co-President of JPMorganChase and CEO of Consumer & Community Banking
Mary Callahan Erdoes	CEO, Asset & Wealth Management
Jennifer Piepszak	Chief Operating Officer of JPMorganChase
Jeremy Barnum	Chief Financial Officer
Ashley Bacon	Chief Risk Officer
Stacey Friedman	General Counsel
Lori Beer	Global Chief Information Officer
Teresa Heitsenrether	Chief Data & Analytics Officer
Robin Leopold	Head of Human Resources
Tim Berry	Global Head of Corporate Responsibility and Chairman of the Mid-Atlantic Region

Source: jpmorganchase.com/about/leadership, accessed 31 August 2026.

EMEA and UK leadership

Conor Hillery and **Matthieu Wiltz** were appointed **co-CEOs for EMEA** in October 2025. Hillery previously ran EMEA investment banking, and before that UK investment banking — a useful signal that the UK coverage franchise is a route to the top of the region. This is press-sourced rather than taken from a JPMorgan filing.

An honest gap

I could **not** identify a currently-named **Senior Country Officer for the UK** from any primary source. Rather than guess, treat this as not found. If you need it, the places to look are: the directors' list in the J.P. Morgan Securities plc annual report at Companies House; the FCA Financial Services Register, which shows approved senior managers (SMF roles) for J.P. Morgan Securities plc and J.P. Morgan Europe Limited; and JPMorgan's own EMEA press releases. Do not repeat a name in an interview that you have not verified.

2.4 The London footprint

The most important methodological point in this report

JPMorgan's group accounts contain **no UK line and no London line**. The finest geographic cut in the FY2025 Form 10-K is **EMEA: 31,030 employees**. Anyone who quotes you a "London revenue" figure taken from group accounts has made it up. Genuine UK numbers exist in one place only: the statutory accounts of the UK legal entities, filed at Companies House. Everything in this section is labelled by which of the two it came from.

The legal entities, and what each one is for

Figure 8 The UK legal-entity map — where London activity actually books

Simplified. Only entities confirmed from the FY2025 Form 10-K Exhibit 21, the CRD IV Governance Disclosures (Sept 2025) and Companies House filings are shown. J.P. Morgan SE (Germany) holds the EU-facing business and is not shown. Figures are J.P. Morgan Securities plc FY2025 statutory accounts.

Figure 4. Where London activity actually books. Sources: FY2025 Form 10-K Exhibit 21; CRD IV Governance Disclosures (September 2025); J.P. Morgan Securities plc FY2025 statutory accounts filed at Companies House 10 May 2026.

JPMorgan's own **CRD IV Governance Disclosures** state plainly that the UK's two *significant* entities are **J.P. Morgan Securities plc** and **J.P. Morgan Europe Limited**. A third UK presence, the **London Branch of JPMorgan Chase Bank N.A.**, is a branch of the US bank rather than a UK subsidiary.

J.P. Morgan Securities plc — the London engine room

This is the entity that matters most for anyone applying to a markets or investment banking role in London. Its own accounts describe it in terms a candidate should be able to paraphrase:

J.P. Morgan Securities plc, FY2025 annual report — strategic report

"JPMS plc is an **international flagship entity for equity and debt securities across the Markets business**. JPMS plc is the **client facing and traders' employing entity for the majority of Markets (EMEA ex EU)**; and the **primary Banking M&A advisory entity**."

In other words: if you join Markets or M&A in London, this is very likely the company that employs you.

J.P. Morgan Securities plc (USD thousands)	2025	2024
Net operating income	9,542,478	9,144,072
Profit before taxation	3,272,409	3,836,861
Profit after tax	2,344,078	2,596,449
Total assets	830,883,547	697,596,028
Common Equity Tier 1 capital	37,434,585	36,053,977
Total capital	55,987,951	55,806,030
Risk-weighted assets	227,965,642	195,273,360
Leverage exposure	757,149,645	607,589,034
CET1 ratio	16.4%	18.5%
Total capital ratio	24.6%	28.6%
Leverage ratio	6.3%	7.6%
Return on assets	0.3%	0.4%

Source: J.P. Morgan Securities plc, full accounts for the year ended 31 December 2025, filed at Companies House 10 May 2026 (company number 02711006). The filed document is a scanned image; figures were read by optical character recognition and cross-checked against the narrative text in the same document, which independently states "\$9.5 billion", "\$3.3 billion" and "\$830.9 billion".

Three things to take from that table. First, **scale**: a single UK subsidiary holds \$831bn of assets — larger than most European banks in their entirety. Second, **direction**: net operating income rose, driven in the company's own words by "increased client activity in Markets lines of business", while pre-tax profit fell because expenses, "mainly brokerage fees", rose faster. Third, **intensity**: risk-weighted assets grew 17% and the CET1 ratio fell from 18.5% to 16.4%. The entity is being worked harder.

A calibration, clearly marked as inference

JPMS plc's \$9.5bn of net operating income sits against group CIB revenue of \$78.5bn — roughly **12%**. That is a useful order of magnitude for "how big is London within the CIB", but it is **inference, not a disclosed figure**. The two measures are not defined identically, JPMS plc books some activity for other regions, and London activity also books through the N.A. London Branch. Treat 12% as an anchor, not a fact.

The accounts also record three structural changes worth knowing: the Zurich branch continues, focused on sales across Investment Banking, Equities and Corporate Banking; the **Paris branch was deregistered on 13 November 2025**; and a new branch in **GIFT City, India was registered on 8 January 2026**.

Headcount and sites

JPMorgan does not publish a UK headcount. Press reporting in April 2026 put the **UK workforce at around 23,000**, up from roughly 18,000 a decade earlier. Set against the audited EMEA figure of 31,030, that would make the UK about three-quarters of the region — a ratio that is indicative only, since one number is press-sourced and the other audited.

The UK sites are not a matter of inference: they appear as locations on live job requisitions read on 31 August 2026. **London, Bournemouth** (Dorset), **Glasgow**, and **Edinburgh** all carry current vacancies, and a Global Private Bank programme also lists **Manchester**. Glasgow and Bournemouth are substantial technology and operations centres, not satellite offices — several 2027 graduate programmes are based there rather than in London.

On the office estate: JPMorgan occupies **25 Bank Street** in Canary Wharf, which is also cited as Chase UK's registered address. Press reports from November 2025 describe plans for a new Canary Wharf headquarters of around **three million square feet** housing up to **12,000 staff**, co-developed with Canary Wharf Group and designed by Foster + Partners, with a roughly six-year build. I could not find a JPMorgan press release confirming those dimensions, so treat them as press-reported.

Brexit — and the quiet partial reversal

After the 2016 referendum JPMorgan built out **J.P. Morgan SE** in Germany as its EU-facing bank and expanded in Paris, Dublin, Luxembourg, Milan and Madrid. The consensus expectation was a permanent drain of London jobs.

That is not what happened. In **April 2026** JPMorgan moved a number of trading roles **from Paris back to London**, with executives reportedly concluding they had **overestimated how many EU-based staff the post-Brexit rules actually required**. Paris headcount had grown to over 1,000 since Brexit — against a UK workforce of about 23,000.

That reporting is press-sourced, but there is a corroborating fact in audited accounts: the **Paris branch of J.P. Morgan Securities plc was deregistered on 13 November 2025**. A press claim supported by an independent primary document is worth considerably more than either alone, and this is a good example of how to test a story you read.

Chase UK, and the ring-fencing question

Chase UK is JPMorgan's digital retail bank — a current account and savings proposition with no branches. It is the firm's only scaled consumer bank outside the United States, and it sits inside **J.P. Morgan Europe Limited**. Press reporting put it at more than **2.5 million customers** as at February 2025 and roughly **\$31bn** of UK deposits. It has been loss-making by design during build-out.

Ring-fencing: the live regulatory story, and the best UK talking point available

UK **ring-fencing**, in force since 2019, forces a bank whose retail deposits exceed a threshold to place its retail business in a legally separate, separately capitalised entity that cannot conduct most investment-banking activity. The threshold was **raised from £25bn to £35bn in February 2025**.

J.P. Morgan Europe Limited has disclosed that management "has been considering the strategy and long-term implications of the regulatory requirements for ring-fencing the Chase business if its total core deposits exceed the ring-fencing deposits threshold of £35 billion... as Chase's deposit balances increase."

Meanwhile the regime itself is being loosened. On **18 May 2026** HM Treasury published "*Safeguarding Stability, Enabling Growth: The Ring-Fencing Review*", confirming relaxation including a **"New Growth Allowance"** permitting ring-fenced banks to undertake some currently prohibited activities, and a commitment to review the £35bn threshold every three years. Delivery is via the Financial Services and Markets Bill 2026-27, secondary legislation and PRA rule changes.

Why this is the single best thing to raise in a Chase UK or UK-focused interview: Chase UK's entire strategy is to grow deposits fast. Doing so walks it toward a regime that would impose a costly restructuring — at exactly the moment the Government is making that regime less onerous. The commercial outcome genuinely depends on legislation being drafted now.

The banks currently inside the regime are Barclays, HSBC, Lloyds, NatWest and Santander UK. JPMorgan is not — it is approaching the line, not over it.

What London is a hub for, and what it is not

Sourced from primary documents: London is the **EMEA regional headquarters**; it is where Markets for EMEA ex-EU is traded and booked; it is the primary M&A advisory entity; and it hosts the firm's only large non-US retail bank. Current London vacancies span commodities trading technology, equity-derivatives front office, rates technology, credit quantitative trading, securitised products underwriting, EMEA sponsors lending and fund finance, MENAT private banking, and cross-currency payments product management. That is a genuine global hub, not a regional sales office.

What London is *not*, and this is inference rather than a sourced statement: it is not where firm-level capital is allocated. Every segment CEO and every Operating Committee member is US-based. London runs the EMEA franchise and books global risk; New York decides how much capital the franchise gets.

Part 3 — The business model, dissected

Where every dollar comes from, and which parts of the firm actually carry the profit.

3.1 The reporting structure — and the 2024 reorganisation

JPMorgan reports in four segments. You must know that the structure **changed in the second quarter of 2024**, because a great deal of the material you will read while preparing predates the change and uses the old names.

Before Q2 2024	From Q2 2024	What actually happened
Consumer & Community Banking (CCB)	Consumer & Community Banking (CCB)	Broadly unchanged.
Corporate & Investment Bank (CIB) + Commercial Banking (CB) — two separate segments	Commercial & Investment Bank (CIB) — one segment	The two were merged . Mid-sized corporate lending now sits alongside global markets and M&A. Note that the acronym "CIB" survived the change but now means something different.
Asset & Wealth Management (AWM)	Asset & Wealth Management (AWM)	Broadly unchanged.
Corporate	Corporate	Treasury, the Chief Investment Office, and central functions.

Two naming traps that will catch you out

(1) "CIB" before mid-2024 means *Corporate & Investment Bank*; after, it means *Commercial & Investment Bank*. A 2023 article and a 2026 article using the same three letters are describing different perimeters.

(2) Within the CIB, the client-coverage segment called "**Middle Market Banking**" was renamed "**Commercial & Specialized Industries**" in Q2 2025. Same business, new label.

Figure 7 How JPMorgan is organised, and what each part earned in 2025

Segment revenue on a managed basis, FY2025. Sub-business revenue from the 4Q25 earnings supplement (primary source).

Figure 5. The firm on one page, with FY2025 revenue for every material business line. Source: 4Q25 earnings release financial supplement (managed basis).

3.2 The four segments, compared

FY2025, \$m unless stated	CCB	CIB	AWM	Corporate	Firm
Net revenue (managed)	76,029	78,454	24,073	7,025	185,581
Noninterest expense	40,267	38,216	15,332	1,825	95,640
Provision for credit losses	11,493	2,615	97	7	14,212
Net income	18,245	27,761	6,522	4,520	57,048
Return on equity	32%	18%	40%	—	17%
Overhead ratio	53%	49%	64%	—	52%
Average allocated equity	56,000	149,500	16,000	~111,254	332,754
Employees (31 Dec 2025)	144,196	94,563	29,722	50,031	318,512
Share of firm revenue	41.0%	42.3%	13.0%	3.8%	100%
Share of firm net income	32.0%	48.7%	11.4%	7.9%	100%
Revenue per employee	\$527k	\$830k	\$810k	—	\$583k
Net income per employee	\$127k	\$294k	\$219k	—	\$179k

Segment figures from the 4Q25 earnings release financial supplement, pages 12, 16, 20 and 23. Corporate allocated equity is the residual after the three operating segments and is the author's calculation. Revenue and net income per employee are also the author's calculations from disclosed figures, not JPMorgan disclosures; they use year-end headcount against full-year earnings, so treat them as indicative.

Figure 2 Revenue share vs profit share, FY2025
CIB converts revenue into profit better than CCB does

Figure 6. The gap between the two bars is the story. Source: 4Q25 earnings supplement.

The CIB produces 42% of revenue but **49% of profit**. CCB produces 41% of revenue but only **32% of profit**. The reason is credit and cost: CCB carried **\$11.5bn** of the firm's \$14.2bn credit provision and runs a 53% overhead ratio against the CIB's 49%. Consumer lending is a business where you book revenue up front and discover the cost later.

Figure 6 Spread vs fee mix differs completely by segment
CCB is a lending machine; CIB and AWM are fee machines

Figure 7. The same firm contains three completely different economic engines. Source: 4Q25 earnings supplement.

3.3 Consumer & Community Banking (CCB)

What it is: the American retail bank. Current accounts, savings, credit cards, car loans, mortgages, small business banking, and a fast-growing retail investing arm. Roughly 144,000 people — **45% of the entire firm's headcount**.

Sub-business	What it sells	FY2025 revenue	FY2024
Banking & Wealth Management	Current and savings accounts, branches, J.P. Morgan Wealth Management (mass-affluent investing)	\$42,862m	\$40,943m
Card Services & Auto	Credit cards, card partnerships, car loans and leases	\$28,201m	\$25,467m
Home Lending	Mortgages, and servicing mortgages for others	\$4,966m	\$5,097m

How it earns: overwhelmingly spread. Net interest income was **\$58.2bn of \$76.0bn — 77%**. The remaining \$17.8bn is card interchange, asset management fees on investment accounts, mortgage fees, and \$3.8bn of car-lease income.

Capital and returns: \$56bn of allocated equity generating a **32% ROE**. Attractive, but the cycle sits inside it. The Card Services net charge-off rate was **3.14%** in Q4 2025 and **3.34%** by Q2 2026 — rising, and worth watching.

What drives it: interest rates, employment, and consumer credit quality. It is the most rate-sensitive and most recession-exposed part of the firm. In 2025 it added 1.7 million net new checking accounts and 10.4 million credit card accounts.

London relevance: very low — and this is the single most common mistake candidates make

CCB is a **United States** business. Its branches, cards and mortgages are American. If you are applying in London, CCB is essentially not available to you.

The UK equivalent is **Chase UK**, which sits in J.P. Morgan Europe Limited and is reported inside **International Consumer Banking** — not inside CCB's London headcount. The London graduate route into consumer banking is the **Chase Digital Development Programme**, not a CCB programme. Do not tell a London interviewer you are excited about Chase's branch network.

3.4 Commercial & Investment Bank (CIB) — where most London jobs are

What it is: everything the firm does for companies, governments, financial institutions and investors. It is the largest profit pool in the firm — **\$27.8bn of net income, 49% of the total** — and it is where the overwhelming majority of London front-office roles sit.

Figure 4 Inside the CIB: \$78.5bn of revenue, FY2025
Markets is the biggest block — but Payments alone is bigger than Investment Banking

Figure 8. The CIB is not "the investment bank" in the popular sense. Trading is the biggest block, and Payments alone earns nearly twice what M&A and underwriting earn combined. Source: 4Q25 earnings supplement.

CIB revenue line	FY2025	FY2024	Change	What it is
Investment Banking	\$10,198m	\$9,636m	+6%	Advisory and underwriting fees (\$9,735m of it is fees)
Payments	\$19,331m	\$18,085m	+7%	Moving and holding corporate money
Lending	\$7,601m	\$7,470m	+2%	Corporate loans held on balance sheet
Banking & Payments subtotal	\$37,136m	\$35,267m	+5%	
Fixed Income Markets	\$22,532m	\$20,066m	+12%	Rates, credit, currencies, EM, securitised, commodities
Equity Markets	\$13,250m	\$9,941m	+33%	Cash equities, derivatives, prime brokerage
Securities Services	\$5,599m	\$5,084m	+10%	Custody, fund administration, collateral
Credit adjustments & other	(\$63m)	(\$244m)	—	Valuation adjustments on derivatives
Markets & Securities Services subtotal	\$41,318m	\$34,847m	+19%	
Total CIB	\$78,454m	\$70,114m	+12%	

Investment Banking

The advisory and underwriting business: **M&A, equity capital markets, debt capital markets** and **leveraged finance**, organised around industry coverage groups, country coverage, and sponsor coverage. JPMorgan's own 2027 London posting names its coverage sectors explicitly — Consumer & Retail, Healthcare, Technology, Financial Institutions, Real Estate — and its product areas: M&A, Corporate Finance Advisory, Infrastructure, Ratings Advisory, Sustainable Solutions, ECM and DCM.

League table position: JPMorgan was **#1 globally for investment banking fees in 2025 with 8.4% wallet share**, and 9.3% year-to-date at Q2 2026, when quarterly IB fees of \$3.3bn were the highest since 2021. By product the picture is more contested: for 2025 M&A, LSEG data had **Goldman Sachs first** on both volume (\$1.48tn) and fee revenue (\$4.6bn), with JPMorgan second on \$3.1bn and Morgan Stanley third on \$3.0bn. In debt capital markets JPMorgan led global and Americas volumes, while BNP Paribas led EMEA and HSBC led Asia-Pacific.

The honest reading of the league tables

JPMorgan is **#1 by total fee wallet** — the broadest measure — because it is strong everywhere and dominant in debt. Goldman Sachs remains **#1 in pure M&A**, particularly at the mega-deal end. Both statements are true. A candidate who knows the distinction, and knows that different data providers (LSEG, Dealogic) produce different tables, will sound considerably better informed than one who simply says "JPMorgan is number one".

Markets

Fixed Income Markets (\$22.5bn) covers **rates** (government bonds and interest-rate derivatives — the largest and most liquid market on earth), **credit** (corporate bonds and credit derivatives), **currencies and emerging markets**, **securitised products** (bonds backed by pools of loans), and **commodities**. In Q4 2025 the strength came from Securitised Products, Rates, and Currencies & Emerging Markets, offset by weaker Credit.

Equity Markets (\$13.3bn, up 33%) covers **cash equities** (buying and selling shares for institutions), **equity derivatives**, and **prime brokerage** — the financing and servicing of hedge funds. JPMorgan attributed the 40% fourth-quarter jump specifically to **Prime**, and Q2 2026 saw an extraordinary **86%** year-on-year rise. Prime brokerage is a financing business: it grows when hedge funds borrow more.

This growth has a balance-sheet cost that is visible in the accounts. Trading assets rose from \$637.8bn to \$802.9bn during 2025, CIB allocated equity rose 13% from \$132bn to \$149.5bn, and total firm assets reached \$5.0tn by mid-2026. Markets revenue is not free — it is bought with balance sheet, which is precisely why the CIB's ROE is 18% rather than 40%.

Global Research, and why MiFID II matters

Research analysts publish investment views on companies, sectors and economies. Research earns almost no direct revenue; it exists to win trading commissions and to support the franchise.

MiFID II, the EU regulation applied from January 2018, forced **unbundling**: asset managers had to pay for research separately from trading execution, rather than receiving it "free" in exchange for directing trades. Research budgets fell sharply and coverage of smaller companies thinned.

The UK has since reversed course. The FCA's **PS24/9** introduced **payment optionality**, allowing firms to pay for research bundled with execution again, subject to guardrails — a written policy, annual assessment of value and use, and clear separation of research charges. **PS25/4** extended the same optionality to fund managers. The UK Investment Research Review had concluded that unbundling damaged research provision in the UK.

Why a Research applicant should care

This is the defining commercial question of the job you are applying to. Research spent seven years as a cost centre justified by regulation, and the regulation has now partially reversed. Whether that restores research budgets, and whether scale players like JPMorgan gain share as smaller providers exit, is genuinely open. It is the obvious "why now" question for a Global Research interview.

Payments — the most valuable business nobody has heard of

\$19.3bn of revenue in 2025, a record \$5.1bn in the fourth quarter alone, and \$5.3bn in Q2 2026. Payments is larger than the entire investment banking fee pool, and most candidates cannot describe it.

It does three things. **Treasury services**: running the bank accounts of large corporates worldwide, moving their money between countries and currencies, managing their liquidity. **Merchant acquiring**: processing card payments on behalf of businesses. **Cross-border payments**: moving money internationally, including the correspondent banking network that smaller banks rely on.

Why this business is so prized

Payments earns in two ways at once. It charges **fees** per transaction — and it holds the enormous **deposit balances** that corporate clients leave sitting in their accounts, which fund the bank cheaply and earn spread. That is why CIB net interest income grew 13% in 2025 while average client deposits grew 14%.

And it is extraordinarily **sticky**. A multinational that has plumbed its payroll, supplier payments and treasury systems into one bank across forty countries does not switch because a rival shaves a basis point. Payments consumes little capital, generates recurring revenue, and deepens every other relationship. It is arguably the highest-quality revenue in the firm.

Securities Services

\$5.6bn, up 10%. Custody means holding assets safely on behalf of institutional investors and keeping the records. **Fund administration** means calculating what a fund is worth and producing its reports. **Collateral management** means moving the security that backs derivatives trades.

The economics: fees charged as a few basis points on assets held, plus interest on the cash balances that sit in custody. Capital-light, unglamorous, and remarkably durable — switching custodian is a multi-year operational project. Revenue rises with market levels even without winning a single new client.

Commercial Banking, and the Innovation Economy

The former Commercial Bank now sits inside the CIB as client-coverage segments. Within Banking & Payments revenue of \$37.1bn, coverage splits as: **Global Corporate Banking & Global Investment Banking \$25,285m; Commercial Banking \$11,851m**, comprising **Commercial & Specialized Industries \$8,306m** (renamed from Middle Market Banking in Q2 2025) and **Commercial Real Estate Banking \$3,545m**.

The **Innovation Economy** business serves startups, high-growth technology companies and their venture investors — the space Silicon Valley Bank occupied before its 2023 failure. It is live in London: current vacancies include a "UK Innovation Economy Payments Sales Manager", and there is a 2027 London **Innovation Development Program** full-time analyst role.

Quantitative Research

Quants build the mathematical models that price derivatives, measure risk, and drive electronic trading. They sit alongside traders rather than in a back office: a trader quoting an exotic option is using a model a quant built and validated.

JPMorgan runs several distinct quant populations, and the London 2027 postings make the split explicit — **Quantitative Research Markets, Quantitative Research Risk and Treasury**, and **Quantitative Research Asset Management**. There is also a separate model-risk function (VCG, Model Risk) that independently validates the models. Note carefully that in London these are advertised as **off-cycle internships**, not summer internships — see section 5.1.

3.5 Asset & Wealth Management (AWM)

What it is: managing money for institutions, funds and wealthy individuals. Two halves.

Business	What it does	FY2025 revenue	Pre-tax margin
Asset Management	Runs funds and mandates for institutions and retail investors: equities, fixed income, multi-asset, ETFs, alternatives (private equity, real estate, infrastructure, hedge funds) and liquidity / money-market funds	\$11,700m	35%
Global Private Bank	Serves wealthy individuals and families: investment advice, lending against assets, deposits, estate and tax planning	\$12,373m	37%

Scale: assets under management of **\$4.8tn** and client assets of **\$7.1tn** at end-2025, rising to **\$5.1tn** and **\$7.7tn** by 30 June 2026. The Global Private Bank employed **4,101 client advisors**, up 9% in a year — the firm is hiring aggressively here.

AUM versus client assets — a definition you will be asked about

Assets under management (AUM) is money the firm actively manages and charges a management fee on. **Client assets**, sometimes called assets under supervision, is broader: everything the firm holds or oversees for clients, including assets merely held in custody or in brokerage accounts where the firm earns little or no management fee.

The gap is large — **\$7.1tn of client assets versus \$4.8tn of AUM**. Fee income tracks AUM far more closely. Quoting the bigger number as though it were fee-earning is a classic error.

How it earns: fees. Asset management fees were **\$15.5bn** of the segment's \$17.2bn of noninterest revenue. Net interest income of \$6.8bn comes almost entirely from the Private Bank lending to clients against their portfolios and holding their deposits.

Why it is the jewel: AWM earned **\$6.5bn of net income on just \$16bn of allocated equity — a 40% return**, the highest of any segment, on 5% of the firm's capital. Its weakness is the 64% overhead ratio: paying investment professionals and private bankers is expensive, and the segment is directly exposed to market levels. A 20% equity market fall takes roughly 20% off the fee base with a largely fixed cost base underneath.

Figure 9. Three segments, three completely different capital models. Source: 4Q25 earnings supplement.

3.6 Corporate

Not a business but a container. **Treasury and the Chief Investment Office (CIO)** manage the firm's own money: the \$735bn average investment securities portfolio, the funding, and the interest-rate risk of the balance sheet as a whole. **Other Corporate** holds central items and one-offs.

Corporate produced \$7.0bn of revenue and \$4.5bn of net income in 2025, against \$17.4bn and \$10.6bn in 2024 — a fall that is almost entirely the \$7.9bn Visa gain in 2024 dropping out, plus \$3.7bn less net interest income as rates fell. Corporate also houses **50,031 employees**: the centralised technology, operations, finance, risk, audit and HR functions. Several London graduate programmes — CADP, Global Finance & Business Management, HR — recruit into this population.

3.7 The revenue map: three different answers to "what makes the most money"

Figure 10. Size against capital consumed. Revenue is sourced; the capital-intensity score is the author's inference, since JPMorgan does not publish risk-weighted assets by revenue line.

The question "which part of JPMorgan makes the most money" has three correct and different answers, and being able to separate them is a genuine test of whether you understand the firm.

The question	The answer	The evidence
1. Most absolute profit?	The Commercial & Investment Bank	\$27.8bn of net income — 49% of the firm. Within it, Markets & Securities Services at \$41.3bn is the largest revenue block.
2. Most profit per unit of capital?	Asset & Wealth Management , comfortably	40% ROE versus CIB's 18%. AWM turns \$16bn of equity into \$6.5bn of profit — \$0.41 per dollar of equity , against \$0.33 for CCB and \$0.19 for the CIB.

The question	The answer	The evidence
3. Most profit per head?	The CIB	\$294k of net income per employee, against \$219k in AWM and \$127k in CCB. CCB employs 45% of the firm to generate 32% of profit — retail banking is people-intensive by nature.

And a fourth answer, which is the sophisticated one

By **quality** of revenue — recurring, capital-light, sticky, not dependent on market direction — the best businesses in the firm are **Payments (\$19.3bn)**, **Securities Services (\$5.6bn)** and **Asset Management (\$11.7bn)**. None is the largest. None is the most glamorous. All three would still be earning if markets fell 30% and no company did a deal for a year.

Say this in an interview and you will be making an argument, not reciting a figure.

3.8 The cost side

FY2025 expense line	\$m	% of total	Comment
Compensation	54,487	57.0%	The dominant cost. Rose 6% on higher revenue-related pay and front-office hiring.
Professional and outside services	12,356	12.9%	Consultants, outsourced services, much of it technology.
Technology, communications and equipment	11,029	11.5%	Not the full technology budget — see below.
Marketing	5,531	5.8%	Card acquisition is the bulk of this.
Occupancy	5,461	5.7%	Offices and branches.
Other	6,776	7.1%	Includes firmwide legal expense of just \$361m, down from \$740m.
Total noninterest expense	95,640	100%	Overhead ratio 52%.

The technology number that everyone gets wrong

The income statement shows **\$11.0bn** of "technology, communications and equipment expense". That is not JPMorgan's technology budget. At the February 2026 Company Update the firm guided to **approximately \$19.8bn of technology spend in 2026, up 10%** — a management-defined figure that includes engineers' compensation and outsourced development, which sit in other income-statement lines.

Within that, roughly **\$1.2bn** of additional spend goes to major projects, against about **\$600m** of identified efficiencies, "some of which are AI-related". Total 2026 adjusted expense is guided to **about \$105bn**, up around \$9bn.

If you cite the \$11.0bn as the tech budget you will be wrong by nearly half. If you cite \$19.8bn and can say why it differs from the income statement line, you will be right and will sound like you read the source.

The **overhead ratio** — expense divided by revenue — was **52%** in 2025, and management is explicit that it is not the target. In their words: "we are not managing the Firm for short-term operating leverage... long-term pre-provision net revenue growth is a much better lens through which to assess our investments." Expense discipline at JPMorgan means spending more than competitors while growing revenue faster still.

3.9 Cross-segment synergy — and how much of it is real

Every universal bank claims its parts reinforce each other. At JPMorgan some of that claim is structural fact and some is presentation. It is worth separating them.

The claim	Verdict	Why
Deposits fund lending cheaply	Real, and large	\$2.56tn of deposits, roughly \$604bn of it paying no interest at all. This is a genuine, measurable and enormous funding advantage over non-bank lenders.
Corporate clients buy payments and markets services too	Real	Payments revenue of \$19.3bn and 14% growth in CIB client deposits are the visible output. The merger of Commercial Banking into the CIB in 2024 was done explicitly to make this easier.
Private bank clients buy asset management products	Partly real	Both sit in AWM and share investment platforms — but the Private Bank also sells third-party products, and the revenue is reported separately.
One relationship across the whole firm	Overstated	A US credit-card holder and a European hedge fund have nothing in common. CCB and the CIB share technology, brand and funding — not clients.

The honest summary: synergy is **strongly real within the CIB, real within AWM**, real at the level of funding and technology across the whole firm, and largely **rhetorical between the consumer bank and the wholesale bank**. The 2024 reorganisation is itself evidence — the firm merged the two wholesale segments precisely because that is where the cross-selling genuinely exists.

3.10 Following the money through one deal

Abstractions become concrete when you trace a single transaction. Suppose a UK-listed industrial company decides to buy a competitor for £2bn, funded with new debt.

Figure 9 Following the money through a single UK acquisition

Figure 11. One client decision, six teams, five distinct revenue lines — all inside a single reportable segment.

Each step names a real team you could be interning on. The **coverage banker** in UK Industrials owns the relationship and earns no fee directly, which is why coverage bankers are measured on the total wallet their clients generate rather than on their own P&L. **M&A Advisory** earns a success fee only on completion. **Leveraged Finance or DCM** underwrites the debt and earns a fee for guaranteeing the proceeds. The **Rates and FX desks in Markets** sell the hedges and earn the bid-ask spread, not a fee. **Payments** moves the money and then runs the enlarged group's treasury for years afterwards. **Securities Services** may end up holding the assets.

Two lessons. First, the fee revenue is a one-off; the payments and custody relationships are annuities that outlast it — which is why the unglamorous businesses are so valuable. Second, all of this books inside the **CIB**. When you read that the CIB earned \$78.5bn, this is the machinery underneath it.

Part 4 — What makes JPMorgan different, and where it is exposed

4.1 The fortress balance sheet

"Fortress balance sheet" is Jamie Dimon's phrase and it has been the firm's organising doctrine for twenty years. It means holding more capital and more liquidity than regulators demand, accepting a lower return in good years in exchange for the ability to act in bad ones.

At end-2025 that meant a **CET1 ratio of 14.6%**, **\$1.5tn of cash and marketable securities**, a **liquidity coverage ratio of 111%**, and by mid-2026 **\$590bn of total loss-absorbing capacity** — the layer of capital and debt that can be written down before depositors are touched.

Why this is strategy rather than caution

Excess capital looks like waste until the moment it does not. JPMorgan bought **Bear Stearns** and **Washington Mutual** in 2008 and **First Republic** in 2023 — in each case because it was among the very few institutions with the balance sheet to absorb a failing bank at short notice, and in each case at a price no competitive auction would have produced.

The 2023 US regional banking crisis is the cleanest illustration. Deposits fled smaller banks and a large share of them landed at JPMorgan. The firm was paid for its strength twice over: it gained deposits for nothing, and it acquired First Republic's wealthy client base cheaply. A crisis is a redistribution, and the fortress decides which side of it you are on.

4.2 Scale as strategy — and the counter-argument

The bull argument. Banking has become a fixed-cost industry. Technology, regulatory compliance, cyber security and data infrastructure cost roughly the same whether you serve 10 million or 80 million customers. JPMorgan will spend about **\$19.8bn on technology in 2026**. Very few institutions on earth can match that, and those that cannot must either specialise or fall behind. Spend more, build better, take share in every product at once, and the advantage compounds.

There is evidence for it. In 2025 the firm was #1 in global investment banking fees, grew Markets revenue 19%, grew Payments to a record, grew AUM 18%, opened 1.7 million net new checking accounts and 10.4 million credit card accounts — simultaneously.

The bear argument has three parts, and they deserve to be taken seriously.

- **The law of large numbers.** On \$57bn of net income and \$4.4tn of assets, growth becomes arithmetically hard. There is no acquisition large enough to move the needle that regulators would permit.
- **Spending is not the same as building.** \$19.8bn buys a great deal of legacy maintenance as well as innovation. Management itself said the firm is "probably past the point of peak modernization" and has shifted focus to "modernizing the underlying application code and data" — an admission that the hard part is not finished.
- **Size is taxed.** Systemic capital surcharges rise with size and complexity. Each increment of scale requires more capital per unit of risk than the last.

4.3 The competitive landscape

Figure 10 JPMorgan against its peers — the scale gap is the story

Figure 12. Scale comparison, FY2025. Definitions differ between firms and between currencies; treat as orders of magnitude rather than a like-for-like table.

Competitor	Strategy and product mix	London presence	How it competes with JPMorgan
Bank of America FY25 revenue ~\$113bn, net income \$30.5bn	Universal bank; huge US retail deposit base; strong markets franchise	Large London investment bank and trading floor	The closest structural analogue. Similar model, meaningfully lower returns.
Citigroup FY25 net income \$14.3bn	Universal bank with unmatched global corporate network; multi-year restructuring	Major London hub	Genuinely competitive in payments and treasury services — arguably JPMorgan's only peer in global cash management.
Wells Fargo	Predominantly US commercial and retail; small investment bank	Limited	Barely competes outside US lending.
Goldman Sachs FY25 revenue \$58.3bn, net income \$17.2bn, ROE 15.0%	Advisory and trading elite; asset management growing; consumer retreat	Major London office; EMEA advisory powerhouse	#1 in M&A by volume and fee revenue in 2025. The primary rival for advisory prestige and talent. No deposit base of comparable scale.
Morgan Stanley FY25 revenue \$70.6bn, net income \$16.9bn, ROTCE 21.6%	Wealth management as ballast plus a strong institutional bank	Large London presence	The highest-returning large US bank in 2025. Its wealth-led model is the main strategic alternative to JPMorgan's.
Barclays FY25 income £29.1bn, PBT £9.1bn, RoTE 11.3%	The only UK bank with a genuine full-service investment bank	Headquartered in London	Competes directly in London markets and DCM. Returns roughly a third of JPMorgan's.
HSBC FY25 revenue \$68.3bn, PBT \$29.9bn, RoTE 13.3%	Asia-focused commercial and trade bank	London-headquartered	Dominant in Asian trade finance; not a serious M&A rival.
UBS	World's largest wealth manager post-Credit Suisse; deliberately smaller investment bank	Significant London markets presence	Competes hardest with AWM , not the CIB.
Deutsche Bank / BNP Paribas	European universal banks; BNP led EMEA DCM in 2025	Both large in London	BNP is a real European rival in debt and financing; Deutsche in rates.
NatWest / Lloyds / Santander UK	UK ring-fenced retail and commercial banks	UK-only	Compete with Chase UK , not with the CIB.

The boutiques — a different kind of threat

Evercore, Centerview, Lazard, PJT, Rothschild, Moelis, Perella Weinberg offer advisory only. No trading, no lending, no balance sheet, and therefore no conflict of interest — a genuine selling point when a board wants advice unclouded by the adviser's desire to underwrite the financing.

They cannot underwrite a multi-billion acquisition facility, which is exactly what JPMorgan sells. But they compete ferociously for **people**, offering higher pay per head and faster responsibility. Evercore ranked fifth by M&A fee revenue in 2025 with \$1.7bn — remarkable for a firm a fraction of JPMorgan's size. If you are weighing an investment banking career, this is the real trade-off: balance sheet and breadth against focus and economics.

The non-bank encroachers

Threat	What is happening	JPMorgan's response
Private credit — Apollo, Ares, Blackstone, HPS	Direct lending funds now finance buyouts banks used to. The asset class reached roughly \$3tn globally entering 2025 and is forecast toward \$5tn by 2029. They offer speed, certainty and lighter regulation.	JPMorgan committed \$50bn to its own direct lending platform in 2025, plus \$15bn from co-lenders — joining rather than resisting. Management named "subscription finance" and acquisition finance as 2026 growth drivers.
Payments fintech — Stripe, Adyen	Better technology and developer experience in merchant acquiring, particularly for e-commerce.	Scale, global reach and the ability to hold the client's actual bank account. Payments revenue still grew 7% to \$19.3bn.
Digital retail banks — Revolut, Monzo, Starling	Winning UK current accounts on user experience.	Chase UK is JPMorgan's direct answer — and it competes as a challenger, not an incumbent.

4.4 An honest assessment

Where JPMorgan genuinely stands out

- **Breadth without obvious weakness.** Most banks are strong somewhere and mediocre elsewhere. JPMorgan is top-three in essentially every wholesale product and #1 in the aggregate fee wallet.
- **Funding.** \$2.56tn of deposits, a large slice of it costing nothing. No private credit fund, no fintech and no boutique has anything comparable.
- **Consistency of returns.** ROTCE above 17% in most years and above the cost of equity in bad ones. Management showed at the 2026 Company Update that its ability to earn above its cost of equity is, in their words, "unrivalled by peers".
- **Countercyclical capacity.** The ability to buy distressed institutions during panics is worth more than any single year's earnings.

Where it is exposed

Exposure	The concern	Evidence in the numbers
Interest rates	Roughly half of revenue is spread income; falling rates compress it directly.	NIM fell 2.63% to 2.50% in 2025. 2026 guidance assumes an ~\$2bn rate headwind on 83bp lower average rates.
Consumer credit	CCB is 41% of revenue and the first place a recession appears.	Card net charge-off rate rose from 3.14% (Q4 25) to 3.34% (Q2 26). Firm charge-off rate rose 0.52% → 0.68% → 0.74% over three years.
Private credit	Lending is migrating to funds that are cheaper to run and less regulated.	\$50bn committed to its own direct lending platform — a defensive move by definition.
Markets concentration	Recent results lean heavily on trading, the least predictable revenue.	Equity Markets +33% in 2025 and +86% in Q2 2026, much of it Prime. Trading assets grew \$637.8bn → \$802.9bn.
Capital and regulation	Larger balance sheet, more capital required; rules can change abruptly.	CET1 fell 15.7% → 14.6%; RWAs rose; the Advanced approach became the binding constraint at end-2025.

Exposure	The concern	Evidence in the numbers
Succession	One individual has defined the firm for two decades.	June 2026 clarified the field but set no timetable. Marianne Lake's departure removed a long-assumed successor.
Size itself	Growth is arithmetically harder from a \$57bn base.	2026 expense guidance of ~\$105bn is up ~9%, faster than most plausible revenue growth.

Bull and bear cases over five years

	Bull case	Bear case
Rates	Rates settle at a level historically normal rather than near zero; spread income stays structurally higher than the 2010s.	Rates fall further and faster than the forward curve implies; the post-2022 windfall unwinds.
Share	Scale and technology spending keep taking share; competitors retrench; the fee wallet consolidates further.	Private credit takes the profitable lending; fintech takes payments margin; the bank keeps only the regulated, low-return residue.
Credit	Consumer credit normalises without a recession; reserves prove conservative.	Unemployment rises; card losses accelerate from an already-rising base; CCB profit halves.
Technology	AI delivers real efficiency — the firm has already identified ~\$600m of savings — and JPMorgan's data scale becomes a durable moat.	\$19.8bn a year buys parity, not advantage; expense growth outpaces revenue and the overhead ratio drifts up.
Leadership	An orderly handover to a proven internal successor; the model outlasts the individual.	A disorderly transition, or a successor who changes a strategy that was working.

The balanced judgement

JPMorgan is the best-run large bank in the world by most measurable standards, and it is priced accordingly — a market capitalisation of \$869bn at end-2025, up 78% in two years. The realistic risk is not that it fails; the fortress makes that improbable. The realistic risk is that it becomes a very good, very large, slower-growing utility whose returns drift from 20% toward the 17% through-the-cycle target and stay there — which is, notably, exactly what management itself is guiding toward.

Part 5 — The London summer analyst programmes

Live requisition data, read on 31 August 2026. This is the section that determines what you apply to.

Read this box first — the timing news is unusually good

The **2027 London programmes opened on 31 August 2026** — the day this research was carried out. Nearly every UK requisition carries a posting start date of 31 August 2026 and a stated close of **1 November 2026, 23:55**.

JPMorgan states in the postings themselves: *"We will be filling our classes on a rolling basis. We strongly encourage you to submit your application as early as possible before job postings close."* That language appears in **35 of the 43** UK requisitions found.

The practical consequence: 1 November is a backstop, not a target. Places are filled continuously from September. An application submitted in mid-October competes for whatever is left. Treat the real deadline as late September.

5.1 How this list was obtained, and what that means for you

JPMorgan's public careers pages — careers.jpmorgan.com, which now redirects to jpmorganchase.com/careers — are content shells. They show programme *categories* ("Early Insight", "Internship", "Full-Time") and invite you to join a mailing list. They do not render live vacancies, and no amount of clicking will make them do so.

The live data sits in JPMorgan's Oracle Recruiting Cloud instance. I queried it directly and harvested 2,751 unique requisitions across roughly 35 keyword searches, then filtered to the United Kingdom. Everything in the table below is primary, live data — not a recruitment blog's summary of it.

The URLs you should use yourself, and re-check monthly

Browse all vacancies:

https://jpmc.fa.oraclecloud.com/hcmUI/CandidateExperience/en/sites/CX_1001/requisitions

Go straight to one job (append the Job ID from the table below):

All 43 UK requisitions found are listed across these four tables. Source: JPMorgan Oracle Recruiting Cloud requisition records, read 31 August 2026. Job IDs are stable identifiers; append one to the job URL given above. Closing dates are from the requisition metadata and, for 17 of the postings, are also stated in the description text.

What is NOT there — and this matters as much as what is

No UK Spring Week or first-year insight programme is currently posted. A search for "spring week" returned zero requisitions globally; "early insight" and "insight week" returned matches, none in the UK. The only first-year-accessible UK offerings open now are **Code for Good** and **Data for Good** in Glasgow, both closing 9 October 2026.

No UK-posted "Winning Women" or "Advancing Black Pathways" requisition was found. Both exist as JPMorgan programmes; in EMEA they appear to be run as events rather than ATS vacancies — that is an inference, not a sourced statement.

Where to look instead: re-check the Oracle listing filtered to the United Kingdom monthly from October, and watch the "Early Insight (pre-internship)" category on jpmorganchase.com/careers/explore-opportunities/programs. JPMorgan's EMEA spring programmes have historically opened later in the autumn than summer internships. If you are a first-year student, this is the thing to diarise.

Two gaps in the data I could not close

Intake sizes: the field exists in the requisition record and is **null on every single posting**. JPMorgan does not publish how many people it takes. Any number you read elsewhere is an estimate.

Visa sponsorship: most UK postings are **silent** on it. Two — the Data & AI Summer Internship and the Data & AI Full Time Analyst role — state explicitly: "We do not offer any type of employment-based immigration sponsorship for this program." Whether that is UK-specific policy or template language carried over from US postings, I cannot tell from the text. **If you need sponsorship, verify it on the application form or with the recruiter before investing time.**

Figure 11 The 2027 London cycle — what actually happens when
The window is 9 weeks on paper. In practice the useful window is the first 3-4.

Open and close dates are PRIMARY (JPMorgan Oracle Recruiting requisition records read 31 Aug 2026). The internal stage timings are INFERRED from recruitment-aggregator reporting and are indicative only — JPMorgan does not publish them.

Figure 13. The 2027 London cycle. Open and close dates are primary; internal stage timings are inferred.

5.3 Standardised role profiles

The nine-week structure is common to most of these programmes: five days of induction and training, then placement on a desk or team, then a return-offer decision. The postings say so explicitly. What differs is the work and who it suits.

Global Investment Banking Analyst Program — Summer Internship

Where it sits in the business	CIB → Investment Banking. Touches the \$10.2bn Investment Banking revenue line (of which \$9.7bn is fees).
What the team does	Advises companies on acquisitions, disposals and raising money. You join a Coverage, Advisory or Capital Markets team spanning Consumer & Retail, Healthcare, Technology, Financial Institutions and Real Estate, or products including M&A, Corporate Finance Advisory, Infrastructure, Ratings Advisory, Sustainable Solutions, ECM and DCM.
What an intern actually does	Building and checking financial models in Excel; comparable-company and precedent-transaction analysis ("comps"); assembling pitch books in PowerPoint; company and industry research; profiles of potential targets or buyers; maintaining data rooms. The posting says it plainly: "analyzing market data, building detailed financial models".
Screened for	Precision under pressure, commercial curiosity, resilience, evidence you finish things. Attention to detail is screened harder here than anywhere else — a formatting error in a client document is treated as a serious failure.
Know before day one	The three financial statements and how they link; enterprise vs equity value; DCF and comparable-company valuation; what EBITDA is and why it is used; one live deal you can discuss intelligently. Genuine Excel fluency.
What "good" looks like	Zero errors, work returned early, asking one good question rather than five poor ones, and being visibly reliable at 11pm.
Path at 2 / 5 / 10 years	2: analyst, execution and modelling. 5: associate/VP, running processes and client contact. 10: Executive Director or MD originating business — or, far more commonly, exited to private equity, a corporate development role, or a fund.
Hours, honestly	The hardest in the firm. Long weekdays and frequent weekend work when live. Do not apply because it sounds prestigious.
Competitiveness	Most competitive London programme. Strongest exit optionality in finance, which is why.

Global Markets — Summer Internship (Sales & Trading)

Where it sits in the business	CIB → Markets. Touches Fixed Income (\$22.5bn) and Equity Markets (\$13.3bn) .
--------------------------------------	--

What the team does	Market-making and risk management across rates, credit, currencies, emerging markets, securitised products, commodities, cash equities, equity derivatives and prime brokerage. Note this is the Global Markets posting; Sales is advertised as a separate requisition in London — read both before choosing.
What an intern actually does	JPMorgan's own words: "monitor markets, develop trade ideas, conduct portfolio reviews, and learn about the solutions and products we offer". In practice: morning market summaries, tracking positions, small pricing and data tasks, building sheets that automate something tedious, and absorbing an enormous amount by listening.
Screened for	Fast mental arithmetic, decisiveness under uncertainty, comfort being wrong in public, genuine market interest. Being able to say what you think a market will do and why, then defend it.
Know before day one	What bid-ask spread and market making mean; the difference between cash and derivatives; how a bond price relates to its yield; why central bank policy moves markets. Have a live view on rates or an equity index and the reasoning behind it.
What "good" looks like	Knowing your desk's products cold by week three, having an opinion, and never being the reason a trade is mis-booked.
Path at 2 / 5 / 10 years	2: junior trader or salesperson with limited risk. 5: running a book or a client list. 10: senior trader, desk head, or a move to a hedge fund or asset manager.
Hours, honestly	Brutal start (on the desk before 7am) but far more predictable than banking. Rarely weekends. The intensity is the market's, not the calendar's.
Competitiveness	Very competitive, and screens for a different personality than banking — quicker, blunter, more numerate.

Markets — Research — Summer Internship

Where it sits in the business	CIB → Global Research, supporting the Markets franchise.
What the team does	Publishing investment views on companies, sectors, economies and asset classes for institutional clients.
What an intern actually does	Updating earnings models, gathering and cleaning data, drafting sections of notes, building sector screens, summarising results and industry news for the senior analyst.
Screened for	Genuine writing ability — rarer than numeracy and more valued here. Analytical independence and the confidence to hold a contrarian view with evidence.
Know before day one	How to read a company's accounts; what drives a sector you care about; and the MiFID II research-payment story in section 3.4. That last point is the "why now" question for this seat.
What "good" looks like	A note section that needs almost no editing, and a data point nobody else found.
Path at 2 / 5 / 10 years	2: associate supporting an analyst. 5: publishing analyst with your own coverage. 10: ranked senior analyst — or, very commonly, a move to the buy side.
Hours, honestly	Long around earnings season, calmer between. Better than banking.
Competitiveness	Competitive, and a smaller intake than Markets. Suits deep, writerly analysts over generalists.

Quantitative Research — Off-Cycle Internship (Markets / Risk & Treasury / Asset Management)

Where it sits in the business	CIB Markets, Risk, and AWM. Underpins derivative pricing and electronic trading firmwide.
What the team does	Building the mathematical models that price derivatives, measure risk and drive algorithmic trading. Three separate London streams are advertised, plus associate-level versions for postgraduates.
What an intern actually does	Implementing and testing pricing models in Python or C++; calibrating models to market data; back-testing; writing model documentation; building tooling for traders.
Screened for	Serious mathematics — stochastic calculus, probability, numerical methods — plus real programming. Typically a strong quantitative Master's or PhD, though the analyst stream accepts Bachelor's.
Know before day one	Python to a genuinely fluent standard; linear algebra and probability; ideally exposure to stochastic processes and option-pricing theory.

What "good" looks like	Code that works, is tested, and that a trader trusts. Explaining a model to someone who will never read the mathematics.
Path at 2 / 5 / 10 years	2: quant analyst on a desk. 5: owning a model family. 10: head of quant for an asset class, or a systematic hedge fund.
Hours, honestly	Reasonable, project-driven. Closer to research than to trading hours.
Competitiveness	Note the structural point: in London these are OFF-CYCLE, not summer, internships. If you want quant research in London you must apply to a different programme type than your peers targeting Markets.

Global Payments Analyst Program — Summer Internship

Where it sits in the business	CIB → Payments. The \$19.3bn revenue line — larger than the entire investment banking fee pool.
What the team does	In JPMorgan's own words, learning "what it takes to make money move". Brings together Payments, Merchant Services and Commercial Card across the full "Pay In and Pay Out lifecycle".
What an intern actually does	Client cash-management analysis, product and implementation work, competitor and market research, working with coverage teams, and — per the posting — identifying "opportunities to leverage emerging technologies".
Screened for	Commercial and product instinct rather than pure valuation skill. Structured problem-solving, comfort with technology, client-facing communication.
Know before day one	How money actually moves between banks and countries; what a treasurer worries about; who Stripe and Adyen are and why they matter. Section 3.4 of this report is most of the preparation you need.
What "good" looks like	Understanding a client's operational problem rather than just the product sheet.
Path at 2 / 5 / 10 years	2: product or coverage analyst. 5: product manager or treasury sales. 10: senior product or sales leadership; strong moves into fintech.
Hours, honestly	Genuinely reasonable — closer to corporate hours than banking.
Competitiveness	Materially less competitive than IB or Markets for a business of enormous strategic value. This is arguably the best value-for-effort application on the list.

Securities Services Leadership Programme — Summer Internship

Where it sits in the business	CIB → Securities Services. The \$5.6bn custody, fund administration and collateral business.
What the team does	Holding and servicing institutional clients' assets. The posting frames it as a leadership and project-management programme with exposure "across the full end-to-end business".
What an intern actually does	Per the posting: "develop solutions and drive change in finance using project management, emerging technologies, data governance and analytics" and "drive innovation with the use of digital tools". Process and data work more than markets work.
Screened for	The posting asks for "exceptional writing, verbal communication and client facing skills" and "the aptitude to synthesize large amounts of information".
Know before day one	What custody and fund administration are, and why switching custodian is so hard. The stickiness argument in section 3.4.
What "good" looks like	Owning a project end to end and communicating it clearly to people more senior than you.
Path at 2 / 5 / 10 years	2: product or client-service analyst. 5: product manager or relationship manager. 10: senior leadership in securities services or operations.
Hours, honestly	Among the most civilised in the CIB.
Competitiveness	Less competitive than the front office. Capital-light, sticky, high-quality revenue — a much better business than its reputation among students suggests.

Asset Management Investments & Global Private Bank — Summer Internships

Where it sits in the business	AWM. The 40% ROE segment: Asset Management \$11.7bn, Global Private Bank \$12.4bn.
--------------------------------------	---

What the team does	Asset Management Investments runs money — equities, fixed income, multi-asset, alternatives, liquidity funds. Global Private Bank Advisor serves wealthy families; GPB Investment Solutions builds the portfolios and products behind that advice. A separate Asset Management Risk internship also exists.
What an intern actually does	Investments: company and fund research, portfolio analytics, performance attribution, investment committee materials. Private Bank: client portfolio reviews, market updates, proposals, and a great deal of relationship support.
Screened for	Investments screens for genuine investment interest — a portfolio you run, an investment society, a view you can defend. The Private Bank screens far more for maturity and interpersonal polish; you will sit with very wealthy clients.
Know before day one	How funds charge fees; active versus passive; the difference between AUM and client assets (section 3.5); and for the Private Bank, why an entrepreneur who has just sold a company needs a bank at all.
What "good" looks like	An investment view with the work behind it; or, in the Private Bank, being someone a client is comfortable with.
Path at 2 / 5 / 10 years	2: research or client associate. 5: portfolio manager track or banker with own clients. 10: senior PM or senior banker. Note the GPB advisor count grew 9% in 2025 — they are hiring.
Hours, honestly	The best lifestyle of any front-office route in the firm.
Competitiveness	Competitive but less ferocious than IB. The economics of the segment are the best in the firm, which few students realise.

Software Engineer, Data & AI, and Chase Digital Development Programme

Where it sits in the business	Corporate technology, and Chase UK within International Consumer Banking.
What the team does	Software Engineer: platform, front-office and infrastructure engineering, in Glasgow and London, with a 12-month industrial placement variant. Data & AI: per the posting, "end-to-end data, analytics, and artificial intelligence and machine learning solutions", using AWS, Snowflake, Databricks and LLMs. Chase Digital: product management for the UK digital bank — the posting describes it as starting "your journey in becoming a Product Manager".
What an intern actually does	Real code in real repositories, code review, testing, data pipelines, dashboards. Chase Digital is product rather than engineering: user research, requirements, working with designers and engineers.
Screened for	Engineering: demonstrable code — projects, contributions, internships. Data & AI: Python plus statistics. Chase Digital: product instinct, "an entrepreneurial mindset", and interest in fintech.
Know before day one	Engineering: a language you know well, data structures, version control, some cloud. Chase Digital: use Chase UK, Monzo and Revolut and be able to critique all three.
What "good" looks like	Shipping something that survives review and is still running after you leave.
Path at 2 / 5 / 10 years	2: software engineer II / associate PM. 5: senior engineer or product manager. 10: lead engineer, engineering manager, or senior product — with the strongest external optionality of any route here, into tech and startups.
Hours, honestly	The most reasonable hours in the firm, by a distance.
Competitiveness	Least competitive relative to intake, because most finance-focused applicants ignore these. Note that Glasgow is a genuine engineering centre, not an overflow office. Caution: the Data & AI postings state no immigration sponsorship is offered.

Risk Management, Global Finance & Business Management, CADP and HR

Where it sits in the business	CIB Risk; and the Corporate segment, which employs 50,031 people firmwide.
What the team does	CIB Risk Management is a nine-week programme with a five-day induction, placing you in a risk team — the posting names Credit Risk, which "reviews client credit strength and approves and manages retained credit risk... including investment and non-investment grade syndicated loans, acquisition finance". Global Finance & Business Management is the firm's internal finance function. CADP is a rotational analytics, project management and process improvement programme. HR is the people function.

What an intern actually does	Risk: credit analysis of real borrowers, limit monitoring, portfolio reviews, model outputs. GF&BM: management reporting, business analysis, controls. CADP: data analysis, process mapping, project delivery.
Screened for	Risk screens for judgement and the willingness to say no to a revenue-generating colleague. CADP and GF&BM screen for structured thinking and analytical care.
Know before day one	Risk: what a credit rating means, how default risk is assessed, and section 1.3 of this report. CADP: be comfortable with data.
What "good" looks like	Risk: an analysis whose conclusion holds when challenged. CADP: making a process measurably better.
Path at 2 / 5 / 10 years	2: risk or finance analyst. 5: VP owning a portfolio or reporting area. 10: senior risk or finance leadership. Note CADP's full-time programme is a two-year rotation across all three disciplines.
Hours, honestly	Civilised and predictable across all four.
Competitiveness	Least competitive of the London programmes. Read this honestly: the CADP posting itself states it "is not aligned to front-office, client-facing, or software engineering roles". It is an excellent programme for the right person and a poor consolation prize for someone who wanted IB. Apply to it because you want it.

5.4 Comparing the programmes

Figure 12 The London summer programmes compared
1 = low, 5 = high. These are the author's judgements, not JPMorgan data.

Investment Banking	3	4	1	5	5	5
Global Markets (S&T)	4	4	3	5	4	4
Markets — Sales	3	5	2	5	4	3
Research	4	3	2	3	3	4
Quantitative Research	5	1	5	4	3	4
Global Payments	2	4	2	4	3	3
Securities Services	2	3	2	3	2	2
Asset Management	4	3	2	4	3	4
Global Private Bank	3	5	1	4	3	3
Software Engineering	3	1	5	2	2	4
Data & AI	4	2	5	3	2	4
Risk Management	4	2	3	2	2	3
Global Finance & BM	3	2	2	2	2	3
CADP (Corporate)	2	3	2	2	2	2
	Quantitative intensity	Client-facing	Coding requirement	Proximity to revenue	Hours / intensity	Exit optionality

Figure 14. Scored 1 to 5. These are the author's judgements based on the role descriptions and the business analysis in Part 3 — they are not JPMorgan data and you should argue with them.

Programme	Best exits	Worst reason to pick it
Investment Banking	Private equity, hedge funds, corporate development, growth-stage startups. The broadest exit set in finance.	Because it is the most prestigious. The hours will find you out.
Global Markets / Sales	Hedge funds, asset managers, and market-making firms. Narrower than IB but deeper.	Because you like the idea of trading. Watch a desk first.

Programme	Best exits	Worst reason to pick it
Research	Buy-side analyst roles. A genuinely strong path if you can write.	Because you could not decide between IB and Markets.
Quantitative Research	Systematic hedge funds, quant trading firms, technology. Excellent and well paid.	Because you are "good at maths". The bar is a research-level bar.
Payments	Fintech product and strategy, corporate treasury, payments companies. Underrated.	Because it sounded like an easier route into the CIB.
Securities Services	Asset servicing, operations leadership, fund platforms.	Because it was the only CIB programme you thought you could get.
Asset Management / Private Bank	Asset managers, wealth firms, family offices, multi-manager platforms.	Because the hours are better. They are — but the work is different, not lighter.
Software Engineering / Data & AI	Technology firms, startups, quant firms, any industry at all.	Because you want to move into a front-office finance seat later. That transfer is possible but not the default.
Risk / Finance / CADP	Risk and finance leadership, consulting, corporate strategy.	As a fallback for a front-office ambition — see the CADP posting's own warning above.

5.5 The recruitment process

The stages below are what the postings and widely-reported candidate accounts describe. **Only the application step and the dates are primary**; the internal stage detail is drawn from recruitment aggregators and candidate reports and should be treated as unverified colour.

Stage	What happens	What it is really screening for
1. Application	Online form, CV, and a location preference. JPMorgan's own guidance in the postings: "Help us learn about you by submitting a complete and thoughtful application... it's important to complete all relevant application questions."	Eligibility, academic threshold, and whether your story is coherent for the programme you chose. Several UK postings specify a 2:1 Bachelor's degree (or equivalent) .
2. Online assessment	Numerical and situational-judgement style testing, and for some programmes a timed maths test.	Basic numeracy and consistency. It is a filter, not a differentiator — practise so it is a non-event.
3. HireVue video interview	Asynchronous, recorded. You are given a prompt and record an answer with no interviewer present. Predominantly behavioural, plus a CV walk-through.	Communication under mild artificial stress, motivation for the specific programme, and whether you have done any homework on the firm. Most rejections happen here.
4. Assessment centre / superday	Back-to-back interviews, in the UK usually branded an assessment centre. For IB and Markets expect technical questions on accounting, valuation and markets alongside behavioural ones. May include a case study or group exercise.	Technical competence, and whether the desk wants to sit next to you for nine weeks.
5. Offer	Released on a rolling basis as classes fill.	—

Three specific things to do this week

1. Decide on *at most* two programmes and apply in September, not October. The rolling-basis language is in the postings and it is not decorative.
2. Record a two-minute answer to "walk me through your CV" and watch it back. The HireVue is the highest-attrition stage and the easiest to prepare for.
3. If you are a first-year, diarise a monthly check of the Oracle listing for a UK Spring programme, and apply to Code for Good or Data for Good in Glasgow before 9 October 2026.

5.6 Which one should you actually apply to?

If this is you	Target	Why
You want maximum optionality and will genuinely tolerate the hours	Investment Banking	Broadest exits in finance. Only worth it if the hours are a price you have actually considered, not one you have imagined.

If this is you	Target	Why
You think fast, like being wrong quickly, and follow markets	Global Markets or Sales	Screens for decisiveness and numeracy over polish. Read both postings — they are separate applications.
You are strongly mathematical with real programming ability	Quantitative Research	Remember it is off-cycle in London, so the timeline differs from your peers.
You write well and think independently	Research	Rare skill, smaller intake, and a live regulatory story to discuss.
You are commercially minded but not a modelling obsessive	Payments	Enormous business, far less competition, real product careers. The best value-for-effort application here.
You care about investing itself	Asset Management Investments	Highest-return segment in the firm and a better lifestyle.
You are personable and interested in people's wealth	Global Private Bank	They are expanding advisors 9% a year.
You can code	Software Engineering or Data & AI	Least competitive relative to intake, best external optionality. Check the sponsorship clause.
You are interested in fintech and product	Chase Digital Development Programme	The only true product-management graduate route, and Chase UK is the most interesting strategic story in JPMorgan's UK business.
You like structure, analysis and process	CADP or GF&BM	Genuinely good programmes — but only if you want them, not as a fallback.

On applying to several: what is coherent and what is not

Coherent pairs. Investment Banking + Global Corporate Banking. Global Markets + Sales. Markets + Quantitative Research (if genuinely mathematical). Asset Management + Global Private Bank. Software Engineering + Data & AI. Payments + Securities Services. In each case one story explains both.

Incoherent. Investment Banking + Software Engineering. Private Bank + Quantitative Research. Anything + everything.

The blunt version: recruiters can see your applications. Applying to six unrelated programmes does not multiply your chances; it tells them you have no idea what you want, and the interviewer's first question — "why this team?" — becomes unanswerable. Two well-argued applications beat six scattered ones. If you cannot write a paragraph explaining why a programme follows from what you have already done, do not apply to it.

Part 6 — Reference material

6.1 Glossary

Term	Meaning
Advanced / Standardized approaches	Two regulatory methods for calculating risk-weighted assets. Banks must satisfy both; whichever produces the lower ratio "binds". At end-2025 the Advanced approach became binding for JPMorgan.
AUM — assets under management	Client money the firm actively manages and charges a management fee on. \$4.8tn at end-2025.
Assets under supervision / client assets	A broader measure including assets merely held or overseen, on which little or no management fee is earned. \$7.1tn at end-2025.
Basis point (bp)	One hundredth of one percent. 100bp = 1%.
Bid-ask spread	The gap between the price a market maker will buy at and the price it will sell at. The core earnings mechanism of a trading desk.
CET1 — Common Equity Tier 1	The highest-quality loss-absorbing capital: essentially ordinary shares and retained profits. The CET1 ratio divides it by risk-weighted assets.
Charge-off	A loan written off as uncollectible. The net charge-off rate expresses these as a percentage of loans.
CIB	Since Q2 2024, the Commercial & Investment Bank. Before that, the Corporate & Investment Bank — a different perimeter.
Coverage	Organising client relationships by industry, country or product. A coverage banker owns the relationship rather than a product.
Custody	Holding securities safely on a client's behalf and maintaining the records of ownership.
DCM — debt capital markets	Raising money for clients by issuing bonds.
Delta One	Desks trading instruments that move one-for-one with an underlying index, such as ETFs, swaps and futures.
Derivative	A contract whose value derives from something else — a rate, price or index. Used to hedge risk or gain exposure without owning the underlying asset.
ECM — equity capital markets	Raising money for clients by issuing shares, including IPOs.
Flow vs structured	Flow is high-volume standardised trading at thin margins; structured is bespoke, complex and higher-margin.
Goodwill	The accounting entry created when an acquirer pays more than the book value of what it buys. Excluded from tangible common equity because it cannot absorb losses.
Leverage	Funding assets with borrowed money rather than equity. Magnifies both returns and losses.
Leveraged finance	Arranging debt for already heavily-indebted borrowers, typically to fund private equity buyouts.
LCR — liquidity coverage ratio	Whether a bank holds enough easily-sellable assets to survive 30 days of stress. Must exceed 100%; JPMorgan averaged 111%.
M&A	Mergers and acquisitions — advising companies on buying, selling or defending themselves.
Managed basis	JPMorgan's internal presentation, which grosses up certain tax-advantaged revenue. Managed revenue exceeds reported revenue (\$185.6bn vs \$182.4bn in 2025).
Market making	Continuously quoting buy and sell prices so clients can trade when they wish. Distinct from proprietary trading.
MiFID II	EU regulation applied from 2018 that forced investment research to be paid for separately from trading execution. The UK has since partly reversed this.
NII — net interest income	Interest earned minus interest paid. JPMorgan: \$95.9bn managed in 2025.
NIM — net interest margin	Net interest income as a percentage of interest-earning assets. JPMorgan: 2.50% in 2025; 3.75% excluding Markets.
Overhead ratio	Noninterest expense divided by revenue. JPMorgan: 52% in 2025.

Term	Meaning
PPNR — pre-provision net revenue	Revenue minus expense, before credit losses. Management's preferred growth measure.
Prime brokerage	Financing, securities lending, custody and clearing sold to hedge funds. A major driver of recent Equity Markets growth.
Proprietary trading	Betting the bank's own money on market direction. Largely banned for US banks by the Volcker Rule.
Provision for credit losses	Money set aside in advance for loans expected to go bad. \$14.2bn in 2025.
Ring-fencing	UK rules requiring a large retail bank to sit in a separate, separately capitalised entity insulated from investment banking. Threshold £35bn of core deposits.
ROTCE	Return on tangible common equity — profit as a percentage of shareholders' equity excluding goodwill and intangibles. JPMorgan's through-the-cycle target is 17%.
RWA — risk-weighted assets	Assets re-weighted by riskiness; the denominator of capital ratios. \$1,984bn (Standardized) at end-2025.
Securitised products	Bonds created by bundling together pools of loans such as mortgages or car finance.
SLR — supplementary leverage ratio	Capital against total exposure with no risk-weighting. A backstop to the risk-based ratios.
Sponsors	Private equity firms. The most commercially valuable client group in investment banking.
Spread vs fee revenue	The two fundamental earnings modes: lending margin, versus charging for a service.
Subscription finance	Lending to private-market funds against investors' undrawn commitments. Named by management as a 2026 growth driver.
TLAC	Total loss-absorbing capacity — capital plus debt that can be written down before depositors suffer. \$590bn at Q2 2026.
Underwriting	Guaranteeing that an issuer receives its money, then placing the securities with investors. The fee pays for taking that risk.
Volcker Rule	US rule from the 2010 Dodd-Frank Act restricting banks from proprietary trading.
Wallet share	A bank's percentage of the total industry fee pool. JPMorgan: 8.4% of global IB fees in 2025.

6.2 Assumptions register

Every assumption I made, why I made it, and what changes if it is wrong. If you challenge one item in this report, challenge something here.

#	Assumption	Why I made it	What changes if it is wrong
A 1	The 1 November 2026 deadline is a genuine backstop, and places fill earlier.	JPMorgan states in 35 of 43 UK postings that it fills classes "on a rolling basis" and urges early application. The stated close date is in the requisition metadata.	If wrong and the process is not really rolling, applying in September costs you nothing. The advice is asymmetric, which is why I give it confidently.
A 2	The 43 UK requisitions found represent essentially all currently-open UK early-careers programmes.	2,751 requisitions were harvested across ~35 keyword queries and filtered to the UK. Coverage is broad but keyword-driven.	A programme with unusual title wording could have been missed. Check the Oracle listing filtered to United Kingdom yourself — it takes five minutes and is the authoritative source.
A 3	No UK Spring Week is currently open, rather than my having failed to find one.	"Spring week" returned zero requisitions globally; "insight week", "early insight" and "discovery" returned matches, none in the UK.	If one opens later in the autumn — which history suggests is likely — first-year students would have an additional route. This is the single most likely thing in this report to change within two months.
A 4	J.P. Morgan Securities plc is the entity most London Markets and M&A candidates would join.	Its own FY2025 accounts describe it as "the client facing and traders' employing entity for the majority of Markets (EMEA ex EU); and the primary Banking M&A advisory entity".	Some London staff are employed by JPMorgan Chase Bank N.A. London Branch or other entities. This affects which accounts describe your employer, not your job.
A 5	JPMS plc revenue of \$9.5bn against group CIB revenue of \$78.5bn implies London is roughly 12% of the CIB.	Both figures are primary, but they are not defined identically and the entity does not map cleanly to the segment.	The true figure could plausibly be anywhere from 10% to 20%. Marked as inference throughout; do not quote it as a JPMorgan disclosure.
A 6	UK headcount is approximately 23,000.	Press reporting (Bloomberg and others, April 2026). JPMorgan publishes no UK headcount.	Could be materially different. The audited EMEA figure of 31,030 is the only firm anchor, and it caps the UK number.
A 7	The role-comparison scores in Figure 14 are reasonable.	Derived from the requisition text and the business analysis in Part 3.	These are judgements, not data. If you disagree with one, your disagreement is as valid as my score — argue with it rather than adopting it.
A 8	Recruitment stage detail (online assessment, HireVue, assessment centre) is broadly accurate.	Recruitment aggregators and candidate reports. JPMorgan does not publish its process.	Stages could differ by programme or have changed for this cycle. Only the application step and dates are primary. Do not build your preparation on the assumption that the sequence is fixed.
A 9	Q2 2026 results are not representative of run-rate earnings.	The quarter contained a \$4.6bn Visa gain and an 86% jump in Equity Markets. JPMorgan itself reports figures excluding significant items.	If the elevated trading environment persists, I will have understated the firm's earnings power. Using the adjusted figure is the conservative choice.
A 10	Chase UK remains loss-making and below the ring-fencing threshold.	Press reporting and JPME's own disclosure about "considering the strategy and long-term implications" of crossing £35bn.	I could NOT retrieve JPME's FY2025 profit or loss — see section 6.3. If Chase UK has reached profitability, the strategic story changes materially.
A 11	Pre-2008 corporate history is accurate.	General business knowledge, not verified against a document for this report. Marked as background knowledge in section 2.1.	Dates could be imprecise. The 2023 First Republic acquisition and the 2025-26 Apple Card items are sourced to filings.
A 12	Competitor figures are comparable enough to be placed in one table.	Each is taken from that firm's own 2025 results reporting.	They are NOT strictly like-for-like: revenue definitions differ, HSBC reports in USD, Barclays in GBP, and RoTE and ROTCE are calculated differently. Treat Figure 12 as orders of magnitude only.

6.3 Open questions — what I could not verify, and where you should look

Gap	Status	Where to resolve it
Chase UK / J.P. Morgan Europe Limited FY2025 profit or loss	Not retrieved. The Companies House filing is a scanned image and defeated the text extraction available to me.	Companies House company 00938937, most recent full accounts. Order the PDF and read the income statement and the ring-fencing discussion directly.
UK Senior Country Officer	Not found in any primary source.	The directors' list in the J.P. Morgan Securities plc annual report; the FCA Financial Services Register (senior manager approvals for JPMS plc and JPMEL).
J.P. Morgan Securities plc employee headcount	Not retrieved — the staff-numbers note sits deeper in the accounts than I extracted.	Same Companies House filing, the "Employee information" or "Staff costs" note.
J.P. Morgan International Bank Ltd	Named in the brief but not present in the FY2025 10-K significant-subsiary list. I could not confirm its current status.	Companies House name search; the FCA Register. It may have been merged, renamed or fallen below the significance threshold.
Intake sizes for any programme	Not published. The field is null on every requisition.	Ask a recruiter directly at a campus event. No public source exists.
Return-offer conversion rates	Not published by JPMorgan, and I found no credible primary figure.	Ask current interns or recent joiners. Treat any published percentage as an estimate.
Visa sponsorship policy for UK programmes	Mostly silent; two Data & AI postings explicitly exclude sponsorship.	The application form itself, and the recruiter. Resolve this before applying if it affects you.
Technology spend split by line of business	Referenced in the Company Update transcript but the figures are in the slide deck, which I did not retrieve.	The 2026 Company Update presentation PDF on jpmorganchase.com/ir .
Whether a UK Spring Week will open	Unknown. None posted as at 31 August 2026.	Re-check the Oracle UK listing monthly from October.

6.4 Reading list

What to read	Why it is worth your time
1. JPMorganChase FY2025 Form 10-K — read pages 46 to 60 only	The financial highlights and the executive overview. Do not read all 410 pages. This gives you every headline number with its footnotes.
2. 4Q25 earnings release financial supplement	Twenty-nine pages of tables. Pages 12, 16, 20 and 23 are the four segments. If you read one document before an interview, read this one.
3. The 2026 Company Update transcript, 23 February 2026	How management explains itself in its own words. The ROTCE-as-output passage alone is worth the read.
4. Jamie Dimon's annual letter to shareholders	Long, opinionated, and the single most quoted document in banking interviews. Read the most recent one and know two arguments from it.
5. J.P. Morgan Securities plc statutory accounts (Companies House)	Almost no candidate does this. It tells you what London actually is, in audited numbers.
6. The requisition text of the two programmes you apply to	Interviewers ask "why this programme". The answer is in the posting, and most applicants have not read it carefully.
7. HM Treasury's Ring-Fencing Review (May 2026)	The live UK regulatory story. Essential for Chase UK, useful everywhere in London.
8. FCA PS24/9 and PS25/4 on research payment optionality	Essential if you are applying to Research; good context otherwise.
9. Goldman Sachs and Morgan Stanley FY2025 results	You cannot argue that JPMorgan is well run without knowing what the alternatives look like.
10. Barclays FY2025 results	The clearest illustration of why scale matters: a good UK bank earning roughly a third of JPMorgan's return.
11. Andrew Ross Sorkin, <i>Too Big to Fail</i>	How Bear Stearns and Washington Mutual happened, and why the fortress doctrine exists.
12. Duff McDonald, <i>Last Man Standing</i>	A biography of Dimon and the Bank One turnaround. Explains the culture you would be joining.
13. Financial News London and eFinancialCareers	The best sources on the London market specifically — hiring, pay, and who is moving where.

What to read	Why it is worth your time
14. The FT Lex column and Bloomberg banking coverage	Daily habit. You need one current story you can discuss for any interview.
15. Aswath Damodaran's free valuation materials	If you are applying to Investment Banking and have never built a DCF, start here rather than with a paid course.

- CNBC, "**Private credit's cracks open door for Wall Street banks' comeback**", 27 March 2026, and associated private-credit market sizing. Accessed 31 August 2026.

UNVERIFIED — treated as colour only, not fact

- Recruitment aggregators and candidate-experience sites (Extern, FE Training, IGotAnOffer, Leland, Glassdoor, Wall Street Oasis, Bright Network, TargetJobs) used **only** for the recruitment-stage descriptions in section 5.5, and flagged as such there. No financial figure, deadline, org-chart entry or programme detail in this report rests on any of them.

A closing note on how to use this report

The financial analysis in Parts 1 to 4 will stay broadly valid for a year. The recruitment information in Part 5 will not — it is a photograph of one day, 31 August 2026, and the cycle it describes closes on 1 November 2026.

Before you apply, spend five minutes at https://jpmc.fa.oraclecloud.com/hcmUI/CandidateExperience/en/sites/CX_1001/requisitions filtered to the United Kingdom, and check the programmes you care about are still open. That is the authoritative source. This report is a considered reading of it, not a replacement for it.
